# PRODUCTS INFORMATION

THK develops and provides a large number of linear motion systems products, including LM Guides, Ball Screws and Actuators. All of these are used in various types of industrial equipment such as machine tools, semiconductor manufacturing machines and industrial robots.

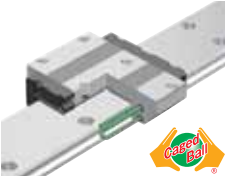

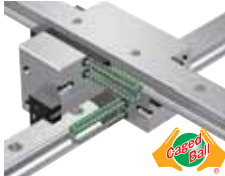

To respond to diversifying requirements, THK has been enhancing its high-performance and high-quality products that can be used in widely varying operating environments.

Select the most suitable product from our broad array of product lineups that respond to various applications.

## Caged Ball LM Guide

# THK Technical Support Site

The THK Technical Support Site lets you access product information and technical support online. You will also find a search feature for locating desired products and a calculation feature for calculating service life. 2D CAD and 3D CAD data are also downloadable.

<http://www.thk.com/>

Enter here.

## Product Information

View information on our products.

Search by model number, description, or any other criteria.

## Detailed Dimensional Drawings

Check detailed product dimensions according to model number.

## Detailed Specifications

Check detailed product specifications according to model number.

Available in 3 languages: Japanese, English, and German

## Technical Information

View technical information, from application examples to research papers.

## FAQ

View inquiries relating to products. You can search by an entire inquiry or answer.

## Technical Calculation

Rated life (service life time) can be calculated simply by entering model number, application criteria, etc.

## 2D CAD Data Downloads

Approximately 4,000 downloadables of 2D CAD data (DXF files) are available.

## 3D CAD Data Downloads

Find 3D CAD data matching your specifications, from rail lengths to installation of option items.

## Catalog Information

Order any of a variety of catalogs. You can also view in PDF format.

- ◆ No user registration required to access Product Information or 2D CAD Data Downloads.
- ◆ To access other services, (free) user registration is required.
- ◆ Use of all services is free.

# Guide to the General Catalog

The THK General Catalog is in two volumes, **A** Technical Descriptions of the Products, and **B** Product Specifications.

A Product Technical Descriptions

A Technical Descriptions of the Products mainly contains product

- Features and Structure
- Point of Selection
- Point of Design
- Mounting Procedure and Maintenance
- Options
- Precautions on Use

■ Point of Selection include test data and service life calculation formulas for use when considering technical features in detail. Further, information relating generally to lubrication and grease-type products in special environments can be found conveniently together in Accessories for Lubrication

B Product Specifications

B Product Specifications contains dimensional drawings and tables according to product and model number.

All information containing product dimensional elements is given.

**With two volumes, you can compare a page of product technical information with the product's dimensional drawings and tables to aid when considering specifications.**

We at THK are sure you will be pleased in finding products among our abundant selection in the General Catalog that fit your needs.

# General Table of Contents

**THK** General Catalog

## THK General Catalog

# General Table of Contents

General Description		A-1
<b>Point of Selection</b> .....		A-2
Selection Flow Chart .....		A-2
Types and Features of LM Systems.....		A-3
Load Rating .....		A-7
• Service Life of an LM System .....		A-7
• Nominal Life .....		A-7
• Basic Load Rating .....		A-7
Basic Dynamic Load Rating $C$ .....		A-7
Basic Static Load Rating $C_0$ .....		A-8
Static Permissible Moment $M_0$ .....		A-8
Static Safety Factor $f_s$ .....		A-9
Life Calculation Formula.....		A-10
Rigidity.....		A-13
• Selecting a Clearance/Preload for an LM System ...		A-13
Clearance and Preload .....		A-13
Preload and Rigidity .....		A-14
Friction coefficient .....		A-15
Accuracy.....		A-16
Lubrication .....		A-16
Safety Design .....		A-18
• Determining a Material .....		A-19
Stainless steel LM Systems .....		A-19
• Surface Treatment .....		A-20
AP-HC .....		A-20
AP-C .....		A-20
AP-CF .....		A-20
• Contamination Protection.....		A-23
<b>LM Guide</b>		<b>A-25</b>
<b>Features and Types</b> .....		A-28
Features of the LM Guide.....		A-28
• Large permissible load and high rigidity .		A-29
• High Precision of Motion .....		A-31
• Accuracy Averaging Effect		
by Absorbing Mounting Surface Error ....		A-34
• Easy Maintenance .....		A-36
• Improved productivity of the machine .....		A-36
• Substantial Energy Savings.....		A-37
• Low Total Cost .....		A-38
• Ideal Four Raceway, Circular-Arc Groove, Two-Point Contact Structure .....		A-39
• Superb Error-Absorbing Capability with the DF Design .....		A-43
Classification Table of the LM Guides .....		A-44
<b>Point of Selection</b> .....		A-46

Flowchart for Selecting an LM Guide .....	A-46
Selecting a Type.....	A-48
• Types of LM Guides .....	A-48
Setting Conditions .....	A-58
• Conditions of the LM Guide .....	A-58
Calculating the Applied Load .....	A-74
• Load rating of the LM Guide in all directions ..	A-74
• Calculating an Applied Load .....	A-75
Calculating the Equivalent Load .....	A-94
Calculating the Static Safety Factor .....	A-95
Calculating the Average Load .....	A-96
• Example of Calculating the Average Load (1) - with Horizontal Mount and Acceleration /Deceleration Considered.....	A-98
• Example of Calculating the Average Load (2) - When the Rails are Movable .....	A-99
Calculating the Nominal Life.....	A-100
• Nominal Life Equation for an LM Guide Using Balls ..	A-100
• Rated Life Equation for an LM Guide Using Rollers...	A-100
• Example of Calculating the Nominal Life (1) - with Horizontal Mount and High-speed Acceleration .....	A-103
• Example of Calculating the Nominal Life (2) - with Vertical Mount .....	A-108
Predicting the Rigidity .....	A-111
• Selecting a Radial Clearance (Preload) ....	A-111
• Service Life with a Preload Considered ...	A-112
• Rigidity .....	A-112
• Radial Clearance Standard for Each Model ....	A-113
Determining the Accuracy .....	A-116
• Accuracy Standards.....	A-116
• Guidelines for Accuracy Grades by Machine Type..	A-117
• Accuracy Standard for Each Model .....	A-118
<b>Feature of Each Model</b> .....	A-129
Structure and Features of the Caged Ball LM Guide.....	A-130
• Advantages of the Ball Cage Technology ...	A-131
Caged Ball LM Guides.....	A-136
• Model SHS.....	A-136
• Model SSR.....	A-142
• Model SNR/SNS .....	A-148
• Model SHW .....	A-156
• Model SRS .....	A-160
• Model SCR .....	A-166
LM Guide .....	A-170
• Model HSR .....	A-170

- **Model SR** ..... A-178
- **Model NR/NRS**..... A-186
- **Model HRW** ..... A-194
- **Models RSR/RSR-W**..... A-200
- **Model RSR-Z** ..... A-208
- **Model RSH** ..... A-214
- **Model RSH-Z** ..... A-218
- **Model HR** ..... A-224
- **Model GSR** ..... A-230
- **Model GSR-R**..... A-236
- **Model CSR** ..... A-244
- **Model MX** ..... A-248
- **Model JR** ..... A-252
- **Model HCR** ..... A-258
- **Model HMG** ..... A-262
- **Model NSR-TBC**..... A-268
- **Model HSR-M1**..... A-272
- **Model SR-M1** ..... A-280
- **Model RSR-M1**..... A-286
- **Model HSR-M2**..... A-292

Structure and Features  
of the Caged Roller LM Guide ..... A-296

- **Advantages of the Caged Roller Technology** .. A-297

Caged Roller LM Guide..... A-300

- **Model SRG** ..... A-300
- **Model SRN** ..... A-306
- **Model SRW** ..... A-312

**Point of Design**..... A-318

Designing the Guide System..... A-318

- **Examples of Arrangements of the Guide System** .... A-318
- **Method for Securing an LM Guide to Meet the Conditions** ..... A-322

Designing a Mounting Surface ..... A-324

- **Designing a Mounting Surface** ..... A-324
- **Shoulder Height of the Mounting Base and the Corner Radius** ..... A-326
- **Permissible Error of the Mounting Surface**.. A-333
- **Marking on the Master LM Guide and Combined Use** ..... A-338

**Mounting Procedure and Maintenance**... A-340

Mounting the LM Guide..... A-340

- **Mounting Procedure** ..... A-340
- **Methods for Measuring Accuracy after Installation** .. A-350
- **Recommended Tightening Torque for LM Rails** .. A-350

**Options**..... A-351

Contamination Protection..... A-352

- **Seal and Metal Scraper** ..... A-352

- **Laminated Contact Scraper LaCS**..... A-353
- **Light-Resistance Contact Seal LiCS** ..... A-355
- **Dedicated bellows** ..... A-356
- **Dedicated LM Cover**..... A-356
- **Cap C**..... A-357
- **Plate Cover SV -- Steel Tape SP** ..... A-358

Lubrication..... A-361

- **QZ Lubricator** ..... A-361
- **Lubrication Adapter** ..... A-364
- **Removing/mounting Jig** ..... A-365
- **End Piece EP**..... A-366

List of Parts Symbols..... A-368

Table of Supported Options by Models..... A-370

Dimensions of Each Model with an Option Attached

- **Seal resistance value** ..... A-372
- **Resistance of LaCS** ..... A-375
- **Maximum Seal Resistance of LiCS**..... A-376
- **Greasing Hole** ..... A-377

**Precautions on Use**..... A-381

Precautions on Using the LM Guide..... A-381

Precautions on Using Options for the LM Guide .. A-382

- **QZ Lubricator** ..... A-382
- **Laminated Contact Scraper LaCS, Side Scraper**.. A-382
- **Light sliding resistance contact seal LiCS**... A-383

**LM Guide Actuator A-385**

**Model KR**..... A-386

Structure and features..... A-386

Types and Features ..... A-390

Load Ratings in All Directions  
and Static Permissible Moment ..... A-391

Maximum Travel Speed and the Maximum Length... A-396

Lubrication..... A-398

Service Life..... A-399

Static Safety Factor ..... A-402

Example of Calculating the Nominal Life... A-403

Accuracy Standards ..... A-412

**Model SKR** ..... A-416

Structure and features..... A-416

Caged Ball/Roller Technology..... A-419

Types and Features ..... A-421

Load Ratings in All Directions  
and Permissible Moment ..... A-422

Lubrication..... A-425

Service Life..... A-426

Accuracy Standards .....	A-428
<b>Options</b> .....	A-430
Cover .....	A-431
Bellows .....	A-432
Sensor .....	A-433
Motor Bracket .....	A-434
<b>Precautions on Use</b> .....	A-436
Precautions on Using Models KR/SKR ....	A-436

## LM Actuator

A-437

### Model GL

Structure and features .....	A-438
• Feature of the LM Actuator Model GL .....	A-438
Structure and features .....	A-438
• Types of the LM Actuator Model GL .....	A-440
Types and Features .....	A-440
Point of Selection .....	A-442
• Load Rating .....	A-442
• Maximum Travel Speed .....	A-443
• Accuracy Standards .....	A-443
Options .....	A-444
• Cover .....	A-444
• Bellows .....	A-445
• Endplate .....	A-445
• Sensor .....	A-445
• Plate Nut for Mounting the Base .....	A-445
Precautions on Use .....	A-446

## Ball Spline

A-447

<b>Features and Types</b> .....	A-450
Features of the Ball Spline .....	A-450
• Structure and features .....	A-450
Classification of Ball Splines .....	A-452
<b>Point of Selection</b> .....	A-454
Flowchart for Selecting a Ball Spline .....	A-454
• Steps for Selecting a Ball Spline .....	A-454
• Selecting a Type .....	A-456
• Studying the Spline Shaft Strength .....	A-458
• Predicting the Service Life .....	A-465
Selecting a Preload .....	A-479
• Clearance in the Rotation Direction .....	A-479
• Preload and Rigidity .....	A-479
• Conditions and Guidelines for Selecting of a Preload .....	A-480

Determining the Accuracy .....	A-482
• Accuracy grade .....	A-482
• Accuracy Standards .....	A-482

### High Torque Type Ball Spline

<b>Model LBS, LBST, LBF, LBR and LBH</b> .....	A-484
• Structure and features .....	A-484
• Applications .....	A-485
• Types and Features .....	A-486
• Service Life .....	A-489
• Clearance in the Rotation Direction .....	A-489
• Accuracy Standards .....	A-489
• Housing Inner-diameter Tolerance .....	A-489
• Spline shaft .....	A-489
• Accessories .....	A-489

### Medium Torque Type Ball Spline

<b>Models LT and LF</b> .....	A-490
• Structure and features .....	A-490
• Types and Features .....	A-492
• Service Life .....	A-494
• Clearance in the Rotation Direction .....	A-494
• Accuracy Standards .....	A-494
• Housing Inner-diameter Tolerance .....	A-494
• Spline shaft .....	A-494
• Accessories .....	A-494

### Rotary Ball Spline With Geared type

<b>Models LBG and LBGT</b> .....	A-496
• Structure and features .....	A-496
• Types and Features .....	A-498
• Service Life .....	A-499
• Clearance in the Rotation Direction .....	A-499
• Accuracy Standards .....	A-499
• Housing Inner-diameter Tolerance .....	A-499
• Spline shaft .....	A-499

### Rotary Ball Spline With Support Bearing type

<b>Model LTR, and LTR-A</b> .....	A-500
• Structure and features .....	A-500
• Types and Features .....	A-502
• Service Life .....	A-503
• Clearance in the Rotation Direction .....	A-503
• Accuracy Standards .....	A-503
• Housing Inner-diameter Tolerance .....	A-503
• Spline shaft .....	A-503

### Point of Design

Checking List for Spline Shaft End Shape .....	A-504
Housing Inner-diameter Tolerance .....	A-505
Positions of the Spline-nut Keyway and Mounting Holes .....	A-505

<b>Mounting Procedure and Maintenance</b> .....	A-506
Assembling the Ball Spline.....	A-506
• <b>Mounting the Spline</b> .....	A-506
• <b>Installing the Spline Nut</b> .....	A-508
• <b>Installation of the Spline Shaft</b> .....	A-508
<b>Options</b> .....	A-509
Lubrication.....	A-509
Material, surface treatment .....	A-509
Contamination Protection.....	A-509
• <b>Specifications of the Bellows</b> .....	A-510
<b>Precautions on Use</b> .....	A-511
• <b>Handling</b> .....	A-511
• <b>Lubrication</b> .....	A-511
• <b>Precautions on Use</b> .....	A-511
• <b>Storage</b> .....	A-512
• <b>Other</b> .....	A-512
<b>Spline Nut</b> <b>A-513</b>	
<b>Features</b> .....	A-514
Features of the Spline Nut .....	A-514
• <b>Structure and features</b> .....	A-514
• <b>Features of the Special Rolled Shafts</b> .....	A-515
• <b>High Strength Zinc Alloy</b> .....	A-515
• <b>Clearance in the Rotation Direction</b> .....	A-516
<b>Point of Selection</b> .....	A-517
Selecting a Spline Nut.....	A-517
<b>Point of Design</b> .....	A-520
Fit .....	A-520
<b>Mounting Procedure and Maintenance</b> .....	A-521
Installation .....	A-521
Lubrication.....	A-521
<b>Linear Bushing</b> <b>A-523</b>	
<b>Features and Types</b> .....	A-524
Features of the Linear Bushing .....	A-524
• <b>Structure and features</b> .....	A-524
• <b>Dedicated Shafts for Model LM</b> .....	A-526
• <b>Standard LM Shafts</b> .....	A-526
• <b>Specially Machined Types</b> .....	A-526
• <b>Table of Rows of Balls and Masses</b> for Clearance-adjustable Types and Open Types of the Linear Bushing ...	A-527
Types of the Linear Bushing .....	A-528
• <b>Types and Features</b> .....	A-528
Classification Table .....	A-534
<b>Point of Selection</b> .....	A-536
Flowchart for Selecting a Linear Bushing .....	A-536
• <b>Steps for Selecting a Linear Bushing</b> .....	A-536
Rated Load and Nominal Life.....	A-537
Table of Equivalent Factors.....	A-540
Accuracy Standards .....	A-541
<b>Point of Design</b> .....	A-542
Assembling the Linear Bushing.....	A-542
<b>Options</b> .....	A-549
Lubrication.....	A-549
Material, surface treatment.....	A-549
Contamination Protection .....	A-550
• <b>Felt Seal Model FLM</b> .....	A-550
<b>Precautions on Use</b> .....	A-551
<b>LM Stroke</b> <b>A-553</b>	
<b>LM Stroke Models ST, ST-B, STI</b> .....	A-554
Structure and features.....	A-554
Types and Features .....	A-555
Rated Load and Nominal Life.....	A-556
Accuracy Standards .....	A-558
Fit .....	A-559
ST shaft.....	A-559
Installation of the ST Shaft .....	A-559
<b>Miniature Stroke Model MST</b> .....	A-560
Structure and features.....	A-560
Fit .....	A-561
Travel Distance of the Ball Cage.....	A-561
<b>Die-setting Ball Cage Models KS and BS</b> .....	A-562
Structure and features.....	A-562
Rated Load and Service Life .....	A-562
Fit .....	A-563
Installation of the Ball Cage.....	A-563
<b>Precautions on Use</b> .....	A-564
<b>Precision Linear Pack</b> <b>A-565</b>	
<b>Features</b> .....	A-566
Features of the Precision Linear Pack .....	A-566
• <b>Structure and features</b> .....	A-566
Rated Load and Nominal Life.....	A-567
Accuracy Standards .....	A-569
Radial Clearance.....	A-569

**Precautions on Use** ..... A-570

## Cross Roller Guide/Ball Guide A-571

**Features and Types** ..... A-572

Features of the Cross Roller Guide/Ball Guide ..... A-572

• **Structure and features** ..... A-572

Types of the Cross Roller Guide/Ball Guide.... A-574

• **Types and Features** ..... A-574

**Point of Selection** ..... A-575

Rated Load and Nominal Life ..... A-575

Accuracy Standards ..... A-578

**Point of Design** ..... A-579

Installation procedure ..... A-579

Example of Clearance Adjustment ..... A-580

Preload ..... A-580

Accuracy of the Mounting Surface ..... A-580

**Options** ..... A-581

Dedicated Mounting Bolt ..... A-581

**Precautions on Use** ..... A-582

## Cross Roller Table A-585

**Features and Types** ..... A-586

Features of the Cross Roller Table ..... A-586

• **Structure and features** ..... A-586

**Point of Selection** ..... A-588

Rated Load and Nominal Life ..... A-588

Accuracy Standards ..... A-590

**Precautions on Use** ..... A-591

## Linear Ball Slide A-593

**Features and Types** ..... A-594

Features of the Linear Ball Slide ..... A-594

• **Structure and features** ..... A-594

Types of the Linear Ball Slide..... A-596

• **Types and Features** ..... A-596

**Point of Selection** ..... A-599

Rated Load and Nominal Life ..... A-599

Accuracy Standards ..... A-601

**Precautions on Use** ..... A-602

## LM Roller

A-603

**Features and Types** ..... A-604

Features of the LM Roller ..... A-604

• **Structure and features** ..... A-604

Types of the LM Roller ..... A-606

• **Types and Features** ..... A-606

**Point of Selection** ..... A-608

Nominal Life..... A-608

Accuracy Standards ..... A-611

**Point of Design** ..... A-612

Raceway ..... A-612

Installing the LM Roller ..... A-613

Guidance for Adjusting the Clearance..... A-614

Examples of Arranging LM Roller Units.... A-615

Examples of Installing the LM Roller ..... A-616

**Options** ..... A-617

Spring Pad Model PA ..... A-617

Fixture Models SM/SMB and SE/SEB..... A-618

**Precautions on Use** ..... A-619

## Flat Roller

A-621

**Features and Types** ..... A-622

Features of the Flat Roller ..... A-622

• **Structure and features** ..... A-622

Types of the Flat Roller ..... A-624

• **Types and Features** ..... A-624

**Point of Selection** ..... A-625

Rated Load and Nominal Life ..... A-625

Accuracy Standards ..... A-628

**Point of Design** ..... A-629

Raceway ..... A-629

Installing the Flat Roller ..... A-630

**Precautions on Use** ..... A-632

## Slide Pack

A-635

**Features and Types** ..... A-636

Features of Slide Pack ..... A-636

• **Structure and features** ..... A-636

Types of the Slide Pack..... A-638

• **Type** ..... A-638

• **Clearance** ..... A-639

**Options** ..... A-640

Contamination Protection.....	A-640
Jointed Slide Rails.....	A-640

<b>Mounting Procedure and Maintenance</b> ....	A-641
Installation .....	A-641
Lubrication.....	A-642

<b>Precautions on Use</b> .....	A-643
---------------------------------	-------

## Slide Rail

A-645

### Features and Types

Features of the Slide Rail.....	A-646
• <b>Structure and features</b> .....	A-646
Types of the Slide Rail .....	A-647
• <b>Types and Features</b> .....	A-647
<b>Single Slides for Light Load</b> .....	A-647
<b>Single Slides for Medium Load</b> .....	A-650
<b>Double Slides for Light Load</b> .....	A-650
<b>Double Slides for Medium Load</b> .....	A-651
<b>Double Slides for Heavy Load</b> .....	A-653
<b>Linear Type Slides</b> .....	A-654
<b>Aluminum Alloy Slide Rail</b> .....	A-655
Classification Table for Slide Rails.....	A-656

<b>Mounting Procedure and Maintenance</b> ....	A-658
Mounting the Slide Rail .....	A-658

<b>Precautions on Use</b> .....	A-659
---------------------------------	-------

## Ball Screw

A-661

<b>Features and Types</b> .....	A-664
Features of the Ball Screw .....	A-664
• <b>Driving Torque One Third of the Sliding Screw</b> ...	A-664
• <b>Ensuring High Accuracy</b> .....	A-667
• <b>Capable of Micro Feeding</b> .....	A-668
• <b>High Rigidity without Backlash</b> .....	A-669
• <b>Capable of Fast Feed</b> .....	A-670
Types of Ball Screws.....	A-672

<b>Point of Selection</b> .....	A-674
Flowchart for Selecting a Ball Screw.....	A-674
Accuracy of the Ball Screw .....	A-677
• <b>Lead angle accuracy</b> .....	A-677
• <b>Accuracy of the Mounting Surface</b> .....	A-680
• <b>Axial clearance</b> .....	A-685
• <b>Preload</b> .....	A-686
Selecting a Screw Shaft .....	A-690
• <b>Maximum Length of the Screw Shaft</b> .....	A-690
• <b>Standard Combinations of Shaft Diameter and Lead for the Precision Ball Screw</b> .....	A-692

• <b>Standard Combinations of Shaft Diameter and Lead for the Rolled Ball Screw</b> .....	A-693
• <b>Permissible Axial Load</b> .....	A-694
• <b>Permissible Rotational Speed</b> .....	A-696
Selecting a Nut .....	A-699
• <b>Types of Nuts</b> .....	A-699
Selecting a Model Number .....	A-702
• <b>Calculating the Axial Load</b> .....	A-702
• <b>Static Safety Factor</b> .....	A-703
• <b>Studying the Service Life</b> .....	A-704
Studying the Rigidity.....	A-707
• <b>Axial Rigidity of the Feed Screw System</b> ..	A-707
Studying the positioning accuracy.....	A-711
• <b>Causes of Error in Positioning Accuracy</b> ..	A-711
• <b>Studying the Lead Angle Accuracy</b> .....	A-711
• <b>Studying the Axial Clearance</b> .....	A-711
• <b>Studying the Axial Clearance of the Feed Screw System</b> .....	A-713
• <b>Studying the Thermal Displacement through Heat Generation</b> .....	A-715
• <b>Studying the orientation change during traveling</b> ....	A-716
Studying the rotational torque .....	A-717
• <b>Friction Torque Due to an External Load</b> ..	A-717
• <b>Torque Due to a Preload on the Ball Screw</b> ....	A-718
• <b>Torque required for acceleration</b> .....	A-718
Studying the Driving Motor .....	A-719
• <b>When Using a Servomotor</b> .....	A-719
• <b>When Using a Stepping Motor (Pulse Motor)</b> ...	A-721
Examples of Selecting a Ball Screw.....	A-722
• <b>High-speed Transfer Equipment (Horizontal Use)</b> ....	A-722
• <b>Vertical Conveyance System</b> .....	A-736

<b>Accuracy of Each Model</b> .....	A-747
Precision, Caged Ball Screw	
Models SBN, SBK and HBN .....	A-748
• <b>Structure and features</b> .....	A-749
• <b>Ball Cage Effect</b> .....	A-749
• <b>Types and Features</b> .....	A-752
• <b>Service Life</b> .....	A-704
• <b>Axial clearance</b> .....	A-685
• <b>Accuracy Standards</b> .....	A-678

### Standard-Stock Precision Ball Screw

#### Unfinished Shaft Ends

<b>Models BIF, BNFN, MDK, MBF and BNF</b> .....	A-754
• <b>Structure and features</b> .....	A-755
• <b>Types and Features</b> .....	A-756
• <b>Service Life</b> .....	A-704
• <b>Nut Types and Axial Clearance</b> .....	A-758

Standard-Stock Precision Ball Screw	
Finished Shaft Ends Model BNK .....	A-760

• <b>Features</b> .....	A-761	<b>Ball Screw Peripherals</b> .....	A-801
• <b>Types and Features</b> .....	A-761	Support Unit Models EK, BK, FK, EF, BF and FF....	A-802
• <b>Table of Ball Screw Types with Finished Shaft Ends and the Corresponding Support Units and Nut Brackets</b> .....	A-762	• <b>Structure and features</b> .....	A-802
		• <b>Type</b> .....	A-804
		• <b>Types of Support Units and Applicable Screw Shaft Outer Diameters</b> .....	A-805
		• <b>Model Numbers of Bearings and Characteristic Values</b> .....	A-806
		• <b>Example of Installation</b> .....	A-807
		• <b>Mounting Procedure</b> .....	A-808
		• <b>Types of Recommended Shapes of the Shaft Ends</b> .....	A-810
Precision Ball Screw		Nut Bracket Model MC .....	A-812
Models BIF, DIK, BNFN, DKN, BLW, BNF, DK, MDK, BLK/WGF and BNT ....	A-764	• <b>Structure and features</b> .....	A-812
• <b>Structure and features</b> .....	A-765	• <b>Type</b> .....	A-812
• <b>Types and Features</b> .....	A-769	Lock Nut Model RN .....	A-813
• <b>Service Life</b> .....	A-704	• <b>Structure and features</b> .....	A-813
• <b>Axial clearance</b> .....	A-685	• <b>Type</b> .....	A-813
• <b>Accuracy Standards</b> .....	A-678		
Precision Rotary Ball Screw Models DIR and BLR ..	A-772	<b>Options</b> .....	A-815
• <b>Structure and features</b> .....	A-773	Lubrication .....	A-816
• <b>Type</b> .....	A-775	Corrosion Prevention (Surface Treatment, etc.) ..	A-816
• <b>Service Life</b> .....	A-704	Contamination Protection .....	A-816
• <b>Axial clearance</b> .....	A-685	• <b>QZ Lubricator</b> .....	A-817
• <b>Accuracy Standards</b> .....	A-776	• <b>Wiper Ring W</b> .....	A-819
• <b>Example of Assembly</b> .....	A-778	• <b>Specifications of the Bellows</b> .....	A-822
Precision Ball Screw / Spline			
Models BNS-A, BNS, NS-A and NS ....	A-780	<b>Mounting Procedure and Maintenance</b> ....	A-824
• <b>Structure and features</b> .....	A-781	Method for Mounting the Ball Screw Shaft...	A-824
• <b>Type</b> .....	A-782	Maintenance Method .....	A-826
• <b>Service Life</b> .....	A-704	• <b>Amount of Lubricant</b> .....	A-826
• <b>Axial clearance</b> .....	A-685		
• <b>Accuracy Standards</b> .....	A-783	<b>Precautions on Use</b> .....	A-827
• <b>Action Patterns</b> .....	A-784		
• <b>Example of Assembly</b> .....	A-787		
• <b>Example of Using</b> .....	A-788		
• <b>Precautions on Use</b> .....	A-789		
Rolled Ball Screw Models JPF, BTK, MTF, BLK/WTF, CNF and BNT .....	A-790		
• <b>Structure and features</b> .....	A-791		
• <b>Types and Features</b> .....	A-792		
• <b>Service Life</b> .....	A-704		
• <b>Axial clearance</b> .....	A-685		
• <b>Accuracy Standards</b> .....	A-678

# Load Rating

## Service Life of an LM System

When an LM system rolls under a load, its raceway and rolling elements (balls or rollers) constantly receive repetitive stress. If a limit is reached, the raceway fractures from fatigue and part of the surface exfoliates like scales. This phenomenon is called flaking.

The service life of an LM system refers to the total travel distance until the first event of flaking occurs due to rolling fatigue of the material on the raceway or the rolling element.

## Nominal Life

The service life of an LM system is subject to slight variations even under the same operating conditions. Therefore, it is necessary to use the nominal life defined below as a reference value for obtaining the service life of the LM system.

The nominal life means the total travel distance that 90% of a group of identical LM system units can achieve without flaking.

## Basic Load Rating

An LM system has two types of basic load ratings: basic dynamic load rating (C), which is used to calculate the service life, and basic static load rating (C<sub>0</sub>), which defines the static permissible limit.

### Basic Dynamic Load Rating C

The basic dynamic load rating (C) indicates the load with constant direction and magnitude, under which the rated life (L) is L = 50 km for an LM system using balls, or L = 100 km for an LM system using rollers, when a group of identical LM system units independently operate under the same conditions.

The basic dynamic load rating (C) is used to calculate the service life when an LM system operates under a load.

Specific values of each LM system model are indicated in the specification table for the corresponding model number.

## Basic Static Load Rating $C_0$

If an LM system receives an excessively large load or a large impact when it is stationary or operative, permanent deformation occurs between the raceway and the rolling element. If the permanent deformation exceeds a certain limit, it will prevent the LM system from performing smooth motion.

The basic static load rating is a static load with a constant direction and magnitude whereby the sum of the permanent deformation of the rolling element and that of the raceway on the contact area under the maximum stress is 0.0001 times the rolling element diameter. With an LM system, the basic static load rating is defined for the radial load.

Therefore, the basic static load rating is considered the limit of the static permissible load.

Specific values of each LM system model are indicated in the specification table for the corresponding model number.

## Static Permissible Moment $M_0$

When an LM system receives a moment, the rolling elements on both ends receive the maximum stress due to uneven distribution of the stress on the rolling elements within the LM system.

The permissible static moment ( $M_0$ ) means the moment with constant direction and magnitude, under which the sum of the permanent deformation of the rolling element and the permanent deformation of the raceway accounts for 0.0001 times of the rolling element's diameter in the contact area where the maximum stress is applied.

With an LM system, the static permissible moment is defined in three directions:  $M_A$ ,  $M_B$  and  $M_C$ . Thus, the static permissible moment is considered the limit of the static moment applied.

$P_c$  : Radial load

$T_c$  : Moment in the torque direction

$M_{A1}$  : Moment in the pitching direction

$M_{A2}$  : Moment in the pitching direction

The specific static permissible moment value of each LM system model is provided in the section on the permissible moments of each model.

## Static Safety Factor $f_s$

The Linear Motion system may receive an unexpected external force while it is stationary or operative due to the generation of an inertia caused by vibrations and impact or start and stop. It is necessary to consider a static safety factor against such a working load.

### [Static Safety Factor $f_s$ ]

The static safety factor ( $f_s$ ) is determined by the ratio of the load capacity (basic static load rating  $C_0$ ) of an LM system to the load applied on the LM system.

$$f_s = \frac{f_c \cdot C_0}{P} \quad \text{or} \quad f_s = \frac{f_c \cdot M_0}{M} \quad \dots\dots\dots (1)$$

- $f_s$  : Static safety factor
- $f_c$  : Contact factor (see Table2 on A-11)
- $C_0$  : Basic static load rating
- $M_0$  : Static permissible moment ( $M_A$ ,  $M_B$  and  $M_C$ )
- $P$  : Calculated load
- $M$  : Calculated moment

### [Measure of Static Safety Factor]

Refer to the static safety factor in Table1 as a measure of the lower limit under the service conditions.

Table1 Measure of Static Safety Factor

Kinetic conditions	Load conditions	Lower limit of $f_s$
Constantly stationary	Impact is small, and deflection of the shaft is also small	1.0 to 1.3
	Impact is present, and a twisting load is applied	2.0 to 3.0
Normal motion	A normal load is applied, and the deflection of the shaft is small	1.0 to 1.5
	Impact is present, and a twisting load is applied	2.5 to 7.0

## Life Calculation Formula

The nominal life (L) of an LM system is obtained from the following equation using the basic dynamic load rating (C) and the applied load (P).

### [LM System Using Balls]

$$L = \left( \frac{C}{P} \right)^3 \times 50 \quad \dots\dots (2)$$

### [LM System Using Rollers]

$$L = \left( \frac{C}{P} \right)^{\frac{10}{3}} \times 100 \quad \dots\dots (3)$$

L	: Nominal life	(km)
C	: Basic dynamic load rating	(N)
P	: Applied load	(N)

In most cases, it is difficult to calculate a load applied on an LM system.

In actual use, most LM systems receive vibrations and impact during operation, and fluctuation of the loads applied on them is assumed. In addition, the hardness of the raceway and the temperature of the LM system unit greatly affect the service life.

With these conditions considered, the practical service life calculation formulas (2) and (3) should be as follows.

### [LM System Using Balls]

$$L = \left( \frac{f_H \cdot f_T \cdot f_C}{f_W} \times \frac{C}{P} \right)^3 \times 50 \quad \dots\dots (4)$$

### [LM System Using Rollers]

$$L = \left( \frac{f_H \cdot f_T \cdot f_C}{f_W} \times \frac{C}{P} \right)^{\frac{10}{3}} \times 100 \quad \dots\dots (5)$$

L	: Nominal life	(km)
C	: Basic dynamic load rating	(N)
P	: Applied load	(N)
$f_H$	: Hardness factor (see Fig.1 on A-11)	
$f_T$	: Temperature factor	
	(see Fig.2 on A-11)	
$f_C$	: Contact factor (see Table2 on A-11)	
$f_W$	: Load factor (see Table3 on A-12)	

●  **$f_H$ : Hardness Factor**

To maximize the load capacity of the LM system, the hardness of the raceways needs to be between 58 and 64 HRC.

If the hardness is lower than this range, the basic dynamic load rating and the basic static load rating decrease. Therefore, it is necessary to multiply each rating by the respective hardness factor ( $f_H$ ).

Fig.1 Hardness Factor ( $f_H$ )

●  **$f_T$ : Temperature Factor**

If the temperature of the environment surrounding the operating LM System exceeds 100 °C, take into account the adverse effect of the high temperature and multiply the basic load ratings by the temperature factor indicated in Fig.2.

In addition, the LM system must be of high temperature type.

Note) If the temperature of the service environment exceeds 80 °C, it is necessary to change the materials of the seal and end plate to high-temperature materials.

Note) If the temperature of the environment exceeds 120°C, it is necessary to provide dimensional stabilization.

Fig.2 Temperature Factor ( $f_T$ )

●  **$f_c$ : Contact Factor**

If multiple LM Guide blocks are closely arranged with each other, it is difficult to achieve uniform load distribution due to a moment load and the accuracy of the mounting surface. In such applications, multiply basic load ratings “C” and “C<sub>0</sub>” by the corresponding contact factors in Table2.

Note) If uneven load distribution is expected in a large machine, take into account the respective contact factor indicated in Table2.

Table2 Contact Factor ( $f_c$ )

Number of blocks used in close contact	Contact factor $f_c$
2	0.81
3	0.72
4	0.66
5	0.61
6 or greater	0.6
Normal use	1

### ● $f_w$ : Load Factor

In general, reciprocating machines tend to involve vibrations or impact during operation. It is extremely difficult to accurately determine vibrations generated during high-speed operation and impact during frequent start and stop. Therefore, where the effects of speed and vibration are estimated to be significant, divide the basic dynamic load rating (C) by a load factor selected from Table3, which contains empirically obtained data.

Table3 Load Factor ( $f_w$ )

Vibrations/ impact	Speed(V)	$f_w$
Faint	Very low $V \leq 0.25\text{m/s}$	1 to 1.2
Weak	Slow $0.25 < V \leq 1\text{m/s}$	1.2 to 1.5
Medium	Medium $1 < V \leq 2\text{m/s}$	1.5 to 2
Strong	High $V > 2\text{m/s}$	2 to 3.5

## Rigidity

When using an LM system, it is necessary to select a type and a clearance (preload) that meet the service conditions in order to achieve the required rigidity of the machine/equipment.

### Selecting a Clearance/Preload for an LM System

Since clearances and preloads of LM systems are standardized for different models, you can select a clearance and a preload according to the service conditions.

For separate-type models, THK cannot adjust their clearances at shipment. Therefore, the user must adjust the clearance when installing the product.

Determine a clearance/preload while referring to the following section.

### Clearance and Preload

#### [Clearance (internal clearance)]

Clearance of an LM system is a play between the block (nut), the rail (shaft) and the ball (or roller). The sum of vertical clearances is called radial clearance, and the sum of circumferential clearances is called angular backlash (clearance in the rotational direction).

#### (1) Radial clearance

With the LM Guide, a radial clearance refers to the value of a movement of the block center when the LM block is gently moved vertically with constant force applied in the center of the fixed LM rail in the longitudinal direction.

Fig.3 Radial clearance of the LM Guide

#### (2) Angular backlash (clearance in the rotational direction)

With the Ball Spline, angular backlash (clearance in the rotational direction) refers to the value of a rotational motion of the nut when the nut is gently rotated forward and backward with constant force with the spline shaft fixed.

Fig.4 Angular backlash of the Ball Spline

**[Preload]**

Preload is a load that is preliminarily applied to the rolling elements in order to eliminate a clearance of an LM system and increase its rigidity. A negative clearance indication (negative value) of an LM system means that a preload is provided.

Table4 Examples of Radial Clearances for LM Guide Model HSR  
Unit:  $\mu\text{m}$

Indication symbol	Normal	Light preload	Medium preload
Model No.	No Symbol	C1	C0
HSR 15	-4 to +2	-12 to -4	—
HSR 20	-5 to +2	-14 to -5	-23 to -14
HSR 25	-6 to +3	-16 to -6	-26 to -16
HSR 30	-7 to +4	-19 to -7	-31 to -19
HSR 35	-8 to +4	-22 to -8	-35 to -22

For specific clearances and preloads, see the section concerning the corresponding model.

**Preload and Rigidity**

Providing a preload to an LM system will increase the rigidity according to the amount of the preload. Fig.5 shows deflection of clearances (normal clearance, clearance C1 and clearance C0) (with LM Guide model HSR).

Fig.5 Rigidity Data

Thus, a preload has an effect of up to approximately 2.8 times greater than the applied preload itself. The deflection with a preload under a given load is smaller, and the rigidity is much greater, than that without a preload.

Fig.6 shows how the radial deflection of an LM Guide changes with a preload. As indicated in Fig.6, when an LM Guide block receives a radial load of 2.45 kN, the radial deflection is  $9\mu\text{m}$  if the radial clearance is zero (normal clearance) or  $2\mu\text{m}$  if the radial clearance is  $-30\mu\text{m}$  (clearance C0), thus increasing the rigidity by 4.5 times.

Fig.6 Radial Clearance and Deflection

For selecting a specific clearance, see the section concerning selection of a radial clearance for the corresponding LM system model.

## Friction coefficient

Since an LM system makes rolling motion via its rolling elements such as balls and rollers between the raceways, its frictional resistance is 1/20 to 1/40 smaller than a sliding guide. Its static friction is especially small and almost the same as dynamic friction, preventing the system from experiencing “stick-slip.” Therefore, the system is capable of being fed by the submicron distance.

The frictional resistance of an LM system varies according to the type of the LM system, preload, viscosity resistance of the lubricant and the load applied on the LM system.

In particular, when a moment is given or a preload is applied to increase rigidity, the frictional resistance increases.

Normal friction coefficient by LM systems are indicated in Table5.

Fig.7 Relationship between Applied Load Ratio and Frictional Resistance

Table5 Frictional Resistances ( $\mu$ ) of LM Systems

Types of LM systems	Representative types	Frictional resistance ( $\mu$ )
LM Guide	SSR, SHS, SNR/SNS, SRS, RSR, HSR, NR/NRS	0.002 to 0.003
	SRG, SRN	0.001 to 0.002
Ball Spline	LBS, LBF, LT, LF	0.002 to 0.003
Linear Bushing	LM, LMK, LMF, SC	0.001 to 0.003
LM Stroke	MST, ST	0.0006 to 0.0012
LM Roller	LR, LRA	0.005 to 0.01
Flat Roller	FT, FTW	0.001 to 0.0025
Cross-roller Guide/Cross-roller Table	VR, VRU, VRT	0.001 to 0.0025
Linear Ball Slide	LS	0.0006 to 0.0012
Cam Follower/Roller Follower	CF, NAST	0.0015 to 0.0025

## Accuracy

The motion accuracy of an LM system is defined in running accuracy for models that are fixed on the flat surface and in runout accuracy for models whose shafts are supported, and accuracy grades are established for each of them.

For details, see the page concerning the corresponding model.

## Lubrication

When using an LM system, it is necessary to provide effective lubrication. Using the product without lubrication may increase wear of the rolling elements or shorten the service life.

A lubricant has the following effects.

1. Minimizes friction in moving elements to prevent seizure and reduce wear.
2. Forms an oil film on the raceway to decrease stress acting on the surface and extend rolling fatigue life.
3. Covers the metal surface to prevent rust formation.

To fully bring out an LM system's functions, it is necessary to provide lubrication according to the conditions.

Even with an LM system with seals, the internal lubricant gradually seeps out during operation. Therefore, the system needs to be lubricated at an appropriate interval according to the conditions.

### [Types of Lubricants]

LM systems mainly use grease or sliding surface oil for their lubricants.

The requirements that lubricants need to satisfy generally consist of the following.

- (1) High oil film strength
- (2) Low friction
- (3) High wear resistance
- (4) High thermal stability
- (5) Non-corrosive
- (6) Highly anti-corrosive
- (7) Minimal dust/water content
- (8) Consistency of grease must not be altered to a significant extent even after it is repeatedly stirred.

Lubricants that meet these requirements include the following products.

Table6 Lubricants for General Use

Lubricant	Type	Brand name
Oil	Sliding surface oil or turbine oil ISOVG32 to 68	Super Multi 32 to 68 (Idemitsu) Vactra No.2S (ExxonMobile) DT Oil (ExxonMobile) Tonner Oil (Showa Shell Sekiyu) or equivalent

Table7 Lubricants Used under Special Environments

Service environment	Lubricant characteristics	Brand name
High-speed moving parts	Grease with low torque and low heat generation	AFG Grease(THK) see A-968 AFA Grease(THK) see A-959 NBU15(NOK Kluba) Multemp (Kyodo Yushi) or equivalent
Vacuum	Fluorine based vacuum grease or oil (vapor pressure varies by brand) <small>Note 1</small>	Fomblin Grease (Solvay Solexis) Fomblin Oil (Solvay Solexis) Barrierta IEL/V (NOK Kluba) Isoflex(NOK Kluba) Krytox (Dupont)
Clean room	Grease with very low dust generation	AFE-CA Grease(THK) see A-963 (The above vacuum grease products also applicable) AFF Grease(THK) see A-965
Environments subject to microvibrations or microstrokes, which may cause fretting corrosion	Grease that easily forms an oil film and has high fretting resistance	AFC Grease(THK) see A-961
Environments subject to a spattering coolant such as machine tools	Highly anti-corrosive, refined mineral oil or synthetic oil that forms a strong oil film and is not easily emulsified or washed away by coolant Water-resistant grease <small>Note 2</small>	Super Multi 68 (Idemitsu) Vactra No.2S (ExxonMobile) or equivalent

Note1) When using a vacuum grease, be sure that some brands have starting resistances several times greater than ordinary lithium-based greases.

Note2) In an environment subject to a spattering water-soluble coolant, some brands of intermediate viscosity significantly decrease their lubricity or do not properly form an oil film. Check the compatibility between the lubricant and the coolant.

Note3) Do not mix greases with different physical properties.

Note4) For THK original grease products, see A-958.

## Safety Design

LM systems are used in various environments. If using an LM system in a special environment such as vacuum, anti corrosion, high temperature and low temperature, it is necessary to select a material and surface treatment that suit the service environment.

To support use in various special environments, THK offers the following materials and surface treatments for LM systems.

	Description	Model No.	Features/Capabilities
Material	Martensite stainless steel		Anti-rust property ★★★★★
	Martensite stainless steel	SR-M1 HSR-M1 RSR-M1 	High temperature support ★★★★★ * up to 150°C
	Austenite stainless steel	HSR-M2 	Anti-rust property ★★★★★
Surface Treatment	AP-HC	THK AP-HC TREATMENT 	Low dust generation ★★★★★ Anti-rust property ★★★ Surface hardness ★★★★★
	AP-C	THK AP-C TREATMENT 	Anti-rust property ★★★★★
	AP-CF	THK AP-CF TREATMENT 	Anti-rust property ★★★★★

\* If you desire a surface treatment other than the above, contact THK.

## Determining a Material

In normal service conditions, LM systems use a type of steel that suits LM systems. If using an LM system in a special environment, it is necessary to select a material that suits the service environment.

For locations that require high corrosion resistance, a stainless steel material is used.

### Material Specifications

# Stainless Steel LM Systems

- Material ··· martensite stainless steel/austenite stainless steel

For use in environments where corrosion resistance is required, some LM system models can use martensite stainless steel.

If the model number of an LM system contains symbol M, it means that the model is made of stainless steel. See the section concerning the corresponding model.

#### Model number coding

<b>HSR25</b>	<b>A</b>	<b>2</b>	<b>QZ</b>	<b>UU</b>	<b>C0</b>	<b>M</b>	<b>+1200L</b>	<b>P</b>	<b>M</b>	<b>- II</b>
Model number			With QZ Lubricator		Radial clearance symbol		LM rail length (in mm)			Symbol for No. of rails used on the same plane
	No. of LM blocks used on the same rail					Stainless steel LM block				Stainless steel LM rail
	Type of LM block			Dust prevention accessory symbol				Accuracy symbol		

## Surface Treatment

The surfaces of the rails and shafts of LM systems can be treated for anti-corrosive or aesthetic purposes.

THK offers THK-AP treatment, which is the optimum surface treatment for LM systems.

The THK-AP treatment consists of the following 3 types.

### AP-HC

- Surface treatment··· industrial-use hard chrome plating
- Film hardness··· 750 Hv or higher

Equivalent to industrial-use hard chrome plating, AP-HC achieves almost the same level of corrosion resistance as martensite stainless steel. In addition, it is highly wear resistant since the film hardness is extremely high, 750 Hv or higher.

### AP-C

- Surface treatment··· industrial-use black chrome coating

A type of industrial-use black chrome coating designed to increase corrosion resistance. It achieves lower cost and higher corrosion resistance than martensite stainless steel.

### AP-CF

- Surface treatment··· industrial-use black chrome coating / special fluorocarbon resin coating

A compound surface treatment that combines black chrome coating and special fluorine resin coating and is suitable for applications requiring high corrosion resistance.

In addition to the above treatments, other surface treatments are sometimes performed on areas other than the raceways, such as alkaline coloring treatment (black oxidizing) and color anodize treatment. However, some of them are not suitable for LM systems. For details, contact THK.

If using an LM system whose raceways are surface treated, set a higher safety factor.

#### Model number coding

Note) Note that the inside of the mounting hole is not provided with surface treatment.

[Data on Comparison of Dust Generation with AP Treatment]

[Test conditions]

Item	Description
LM Guide model number	SSR20WF+280LF (AP-CF, without seal)
	SSR20UUF+280LF (AP-CF, with seal)
	SSR20WUUF+280LF (AP-HC, with seal)
Grease used	THK AFE-CA Grease
Grease quantity	1cc (per LM block)
Speed	30m/min(MAX)
Stroke	200mm
Flow rate during measurement	1l/min
Clean room volume	1.7 liter (acrylic casing)
Measuring instrument	Dust counter
Measured particle diameter	0.3µm or more

General Description

THK AP-HC treatment provides high surface hardness and has high wear resistance. The high level of wear in the early stage in the graph above is considered to be due to the initial wear of the end seal.

Note) THK AP-HC treatment (equivalent to hard chrome plating)  
THK AP-CF treatment (equivalent to black chrome plating + fluorine resin coating)

## Contamination Protection

Contamination protection is the most important factor in using an LM system. Entrance of dust or other foreign material into the LM system will cause abnormal wear or shorten the service life.

Therefore, when entrance of dust or other foreign material is predicted, it is necessary to select a sealing device or contamination protection device that meets the service environment conditions.

### (1) Dedicated seals for LM systems

For LM systems, seals made of special synthetic rubber with high wear resistance (e.g., Laminated Contact Scraper LaCS) and a wiper ring are available as contamination protection seals. For locations with adverse service environments, dedicated bellows and dedicated covers are available for some models.

For details and symbols of these seals, see the section concerning options (contamination protection) for the corresponding model.

To provide contamination protection also for Ball Screws in service environments subject to cutting chips and cutting fluids, it is advisable to use a telescopic cover that covers the whole system and a large-size bellows.

### (2) Dedicated bellows

For LM Guides, standardized bellows are available.

THK manufactures dedicated bellows also for other LM systems such as Ball Screws and Ball Splines. Contact THK for details.

Contamination Protection Seal for the LM Guide

Dedicated Bellows for the LM Guide

Wiper Ring for the Ball Screw

## Features of the LM Guide

### Functions Required for Linear Guide Surface

**Large permissible load**  
**Highly rigid in all directions**  
**High positioning repeatability**  
 Running accuracy can be obtained easily  
 High accuracy can be maintained over a long period

**Smooth motion with no clearance**  
**Superbly high speed**  
**Easy maintenance**  
**Can be used in various environments**

### Features of the LM Guide

#### Large permissible load and high rigidity

Accuracy averaging effect by absorbing mounting surface error

Ideal four raceway, circular-arc groove, two point contact structure

Superb error-absorbing capability with the DF design

#### Low friction coefficient

Wide array of options (QZ lubricator, Laminated contact scraper LaCS, etc.)

As a result, the following features are achieved.

#### Easy maintenance

Improved productivity of the machine

Substantial energy savings

Low total cost

Higher accuracy of the machine

Higher efficiency in machine design

## Large Permissible Load and High Rigidity

### [Large Permissible Load]

The LM Guide has raceway grooves with a radius almost equal to the ball radius, which is significantly different from the linear bushing. As shown in Fig.1, which compares size between the LM Guide and the linear bushing with similar basic dynamic load ratings, the LM Guide is much smaller than the linear bushing, indicating that the LM Guide allows a significantly compact design.

The reason for this space saving is the greater difference in permissible load between the R-groove contact structure and the surface contact structure. The R-groove contact structure (radius: 52% of the ball radius) can bear a load per ball 13 times greater than the surface contact structure. Since service life is proportional to the cube of the permissible load, this increased ball-bearing load translates into a service life that is approximately 2,200 longer than the linear bushing.

**LM Guide model SSR15XW**

**Basic dynamic load rating: 14.7 kN**

**Linear Bushing model LM80 OP**

**Basic dynamic load rating: 7.35 kN**

Fig.1 Comparison between the LM Guide and the Linear Bushing

Table1 Load Capacity per Ball (P and P<sub>1</sub>)

Permissible contact surface pressure: 4,200 MPa

	R-groove (P)	Flat surface (P <sub>1</sub> )	P/P <sub>1</sub>
φ 3.175 (1/8")	0.90 kN	0.07 kN	13
φ 4.763 (3/16")	2.03 kN	0.16 kN	13
φ 6.350 (1/4")	3.61 kN	0.28 kN	13
φ 7.938 (5/16")	5.64 kN	0.44 kN	13
φ 11.906 (15/32")	12.68 kN	0.98 kN	13

Fig.2 Load Capacity per Ball

### [High Rigidity]

The LM Guide is capable of bearing vertical and horizontal loads. Additionally, due to the circular-arc groove design, it is capable of carrying a preload as necessary to increase its rigidity. When compared with a feed screw shaft system and a spindle in rigidity, the guide surface using an LM Guide has higher rigidity.

### ● Example of comparing static rigidity between the LM Guide, a feed screw shaft system and a spindle

(vertical machining center with the main shaft motor of 7.5 kW)

Table2 Comparison of Static Rigidity

Unit: N/μm

[Components]

LM Guide: SNR45LC/C0

(C0 clearance: preload = 8.05kN)

Ball Screw: BNFN4010-5/G0

(G0 clearance: preload = 2.64kN)

Spindle: general-purpose cutting spindle

Components	X-axis direction	Y-axis direction	Z-axis direction
LM Guide	—	2110	8700 (radial) 6730 (reverse radial)
Ball screw	330	—	—
Spindle	250	250	280

Note) The rigidity of the feed screw shaft system includes rigidity of the shaft end support bearing.

Fig.3

## High Precision of Motion

### [Small lost motion]

The LM Guide is provided with an ideal rolling mechanism. Therefore, the difference between dynamic and static friction is minimal and lost motion hardly occurs.

**LM Guide model HSR45**

**Square slide + Turcite**

**(Measurements are taken with the single-axis table loaded with a 500-kg weight)**

Fig.4 Comparison of Lost Motion between the LM Guide and a Slide Guide

Table3 Lost Motion Comparison

Unit: μm

Type	Clearance	Test method			
		As per JIS B 6330			Based on minimum unit feeding
		10mm/min	500mm/min	4000mm/min	
LM Guide (HSR45)	C1 clearance (see table below)	2.3	5.3	3.9	0
	C0 clearance (see table below)	3.6	4.4	3.1	1
Square slide + turcite	0.02mm	10.7	15	14.1	14
	0.005mm	8.7	13.1	12.1	13

Radial clearance of the LM Guide

Unit: μm

Symbol	C1	C0
Radial clearance	-25 to -10	-40 to -25

**[High running accuracy]**

Use of the LM Guide allows you to achieve high running accuracy.

**[Measurement method]**

**Pitching accuracy**

**Yawing accuracy**

Fig.5 Dynamic Accuracy of a Single-axis Table

#### [High accuracy maintained over a long period]

As the LM Guide employs an ideal rolling mechanism, wear is negligible and high precision is maintained for long periods of time. As shown in Fig.6, when the LM Guide operates under both a preload and a normal load, more than 90% of the preload remains even after running 2,000 km.

Fig.6 Condition

#### [Conditions]

Model No. : HSR65LA3SSC0 + 2565LP- II

Acceleration/deceleration time in rapid motion  
: 300 ms (acceleration:  $\alpha = 0.833 \text{ m/s}^2$ )

Mass : 6000kg

Drive : Ball Screws

Lubrication : Lithium soap-based grease No. 2  
(greased every 100 km)

Fig.7 Distance Traveled and Remaining Preload

## Accuracy Averaging Effect by Absorbing Mounting Surface Error

The LM Guide contains highly spherical balls and has a constrained structure with no clearance. In addition, it uses LM rails in parallel on multiple axes to form a guide system with multiple-axis configuration. Thus, the LM Guide is capable of absorbing misalignment in straightness, flatness or parallelism that would occur in the machining of the base to which the LM Guide is to be mounted or in the installation of the LM Guide by averaging these errors.

The magnitude of the averaging effect varies according to the length or size of the misalignment, the preload applied on the LM Guide and the number of axes in the multiple-axis configuration. When misalignment is given to one of the LM rails of the table as shown in Fig.8, the magnitude of misalignment and the actual dynamic accuracy of the table (straightness in the horizontal direction) are as shown in Fig.9.

By applying such characteristics obtained with the averaging effect, you can easily establish a guide system with high precision of motion.

Fig.8

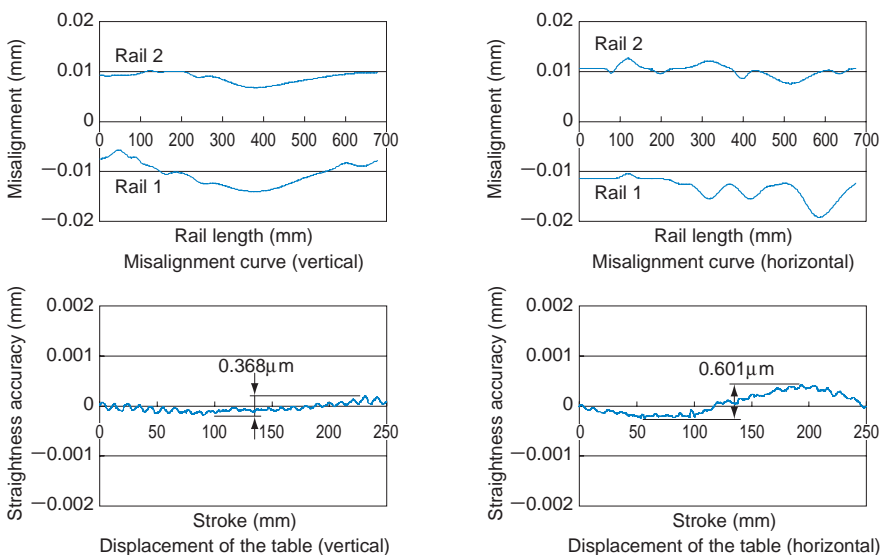

Fig.9

**Features and Types**  
Features of the LM Guide

Even on a roughly milled mounting surface, the LM Guide drastically increases running accuracy of the top face of the table.

**[Example of Installation]**

When comparing the mounting surface accuracy (a) and the table running accuracy (b), the results are :

$$\begin{array}{l} \text{Vertical} \quad \frac{92.5\mu\text{m}}{\quad} \rightarrow \frac{15\mu\text{m}}{\quad} = \frac{1}{6} \\ \text{Horizontal} \quad \frac{28\mu\text{m}}{\quad} \rightarrow \frac{4\mu\text{m}}{\quad} = \frac{1}{7} \end{array}$$

Table4 Actual Measurement of Mounting-Surface Accuracy  
Unit:  $\mu\text{m}$

Direction	Mounting surface	Straightness	Average (a)
Vertical	Horizontal	A	92.5
	Horizontal	B	
Bottom surface	Side surface	C	28
	Side surface	D	

Fig.10 Surface Accuracy of the LM Guide Mounting Base (Milled Surface Only)

Fig.11 Running Accuracy After the LM Guide Is Mounted

Table5 Actual Measurement of Running Accuracy on the Table (Based on Measurement in Fig.10 and Fig.11)

Unit:  $\mu\text{m}$

Direction	Measurement point								Straightness (b)
	1	2	3	4	5	6	7	8	
Vertical	0	+2	+8	+13	+15	+9	+5	0	15
Horizontal	0	+1	+2	+3	+2	+2	-1	0	4

## Easy Maintenance

Unlike with sliding guides, the LM Guide does not incur abnormal wear. As a result, sliding surfaces do not need to be reconditioned, and precision needs not be altered. Regarding lubrication, sliding guides require forced circulation of a large amount of lubricant so as to maintain an oil film on the sliding surfaces, whereas the LM Guide only needs periodical replenishing of a small amount of grease or lubricant. Maintenance is that simple. This also helps keep the work environment clean.

## Improved Productivity of the Machine

Since the LM Guide is superb in high speed, productivity of the machine is improved.

Table6 Examples of Using the LM Guide in High-speed Applications

Machine using the LM Guide	Place where the LM Guide is used	Speed (m/s)	Model No.
Durability test machine	X axis	5.0	SSR25XW
Pick-up robot	X axis	2.0	SSR25XW
	Z axis	3.0	SSR15XW
Injection molding machine	Automatic unloading unit	2.2	HSR30LR
Glass cutter	Cutter sliding unit	3.7	HSR25B
Inspection equipment	Work transfer unit	5.0	HRW27CA
Conveyance robot	Work transport unit	4.2	HSR25R
XY table	X-Y axis	2.3	RSR15WV

## Substantial Energy Savings

As shown in Table7, the LM Guide has a substantial energy saving effect.

Table7 Comparative Data on Sliding and Rolling Characteristics

Machine Specifications		
Type of machine	Single-axis surface grinding machine (sliding guide)	Three-axis surface grinding machine (rolling guide)
Overall length × overall width	13m×3.2m	12.6m×2.6m
Total mass	17000kg	16000kg
Table mass	5000kg	5000kg
Grinding area	0.7m×5m	0.7m×5m
Table guide	Rolling through V-V guide	Rolling through LM Guide installation
No. of grinding stone axes	Single axis (5.5 kW)	Three axes (5.5 kW + 3.7 kW x 2) Grinding capacity: 3 times greater

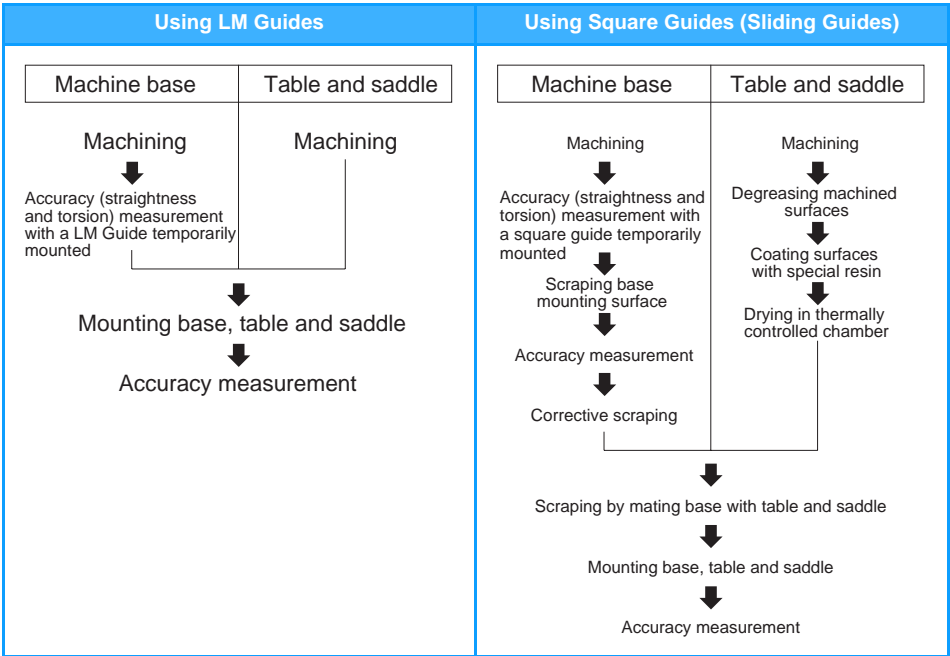

Table Drive Specifications			Ratio
Motor used	38.05kW	3.7kW	10.3
Drive hydraulic pressure	Bore diameter $\phi 160 \times 1.2$ MPa	Bore diameter $\phi 65 \times 0.7$ MPa	—
Thrust	23600N	2270N	10.4
Electric Power consumption	38kWH	3.7kWH	10.3
Drive hydraulic pressure oil consumption	400l/year	250l/year	1.6
Lubricant consumption	60 l/year (oil)	3.6 l/year (grease)	16.7

## Low Total Cost

Compared with a sliding guide, the LM Guide is easier to assemble and does not require highly skilled technicians to perform the adjustment work. Thus, the assembly man-hours for the LM Guide are reduced, and machines and systems incorporating the LM Guide can be produced at lower cost. The figure below shows an example of difference in the procedure of assembling a machining center between using sliding guides and using LM Guides.

Normally, with a sliding guide, the surface on which the guide is installed must be given a very smooth finish by grinding. However, the LM Guide can offer high precision even if the surface is milled or planed. Using the LM Guide thus cuts down on machining man-hours and lowers machining costs as a whole.

### [Assembly Procedure for a Machining Center]

When extremely high precision is not required (e.g., running accuracy), the LM Guide can be attached to the steel plate even if the black scale on it is not removed.

**Ideal Four Raceway, Circular-Arc Groove, Two-Point Contact Structure**

The LM Guide has a self-adjusting capability that competitors' products do not have. This feature is achieved with an ideal four raceway, circular-arc groove, two-point contact structure.

**[Comparison of Characteristics between the LM Guide and Similar Products]**

LM Guide

As indicated in Fig.12 and Fig.13, when the ball rotates one revolution, the ball slips by the difference between the circumference of the diameter of inner surface ( $\pi d_1$ ) and that of the outer contact diameter ( $\pi d_2$ ). (This slip is called differential slip.) If the difference is large, the ball rotates while slipping, the friction coefficient increases more than 10 times and the friction resistance steeply increases.

Four Raceway, Circular-Arc Groove, Two-Point Contact Structure	Two-Row, Gothic-Arch Groove, Four Point Contact Structure
<b>Smooth Motion</b>	
<p>Since the ball contacts the groove at two points in the load direction as shown in Fig.12 and Fig.13 on A-39 even under a preload or a normal load, the difference between <math>d_1</math> and <math>d_2</math> is small and the differential slip is minimized to allow smooth rolling motion.</p>	<p>The difference between <math>d_1</math> and <math>d_2</math> in the contact area is large as shown in Fig.12 and Fig.13 on A-39. Therefore, if any of the following occurs, the ball will generate differential slip, causing friction almost as large as sliding resistance and shortening the service as a result of abnormal friction.</p> <ol style="list-style-type: none"> <li>(1) A preload is applied.</li> <li>(2) A lateral load is applied.</li> <li>(3) The mounting parallelism between the two axes is poor.</li> </ol>
<b>Accuracy and Rigidity of the Mounting Surface</b>	
<p>In the ideal two-point contact structure, four rows of circular arc grooves are given appropriate contact angles. With this structure, a light distortion of the mounting surface would be absorbed within the LM block due to elastic deformation of the balls and moving of the contact points to allow unforced, smooth motion. This eliminates the need for a robust mounting base with high rigidity and accuracy for machinery such as a conveyance system.</p>	<p>With the Gothic-arch groove product, each ball contacts the groove at four points, preventing itself from being elastically deformed and the contact points from moving (i.e., no self-adjusting capability). Therefore, even a slight distortion of the mounting surface or an accuracy error of the rail bed cannot be absorbed and smooth motion cannot be achieved. Accordingly, it is necessary to machine a highly rigid mounting base with high precision and mount a high precision rail.</p>
<b>Rigidity</b>	
<p>With the two-point contact, even if a relatively large preload is applied, the rolling resistance does not abnormally increase and high rigidity is obtained.</p>	<p>Since differential slip occurs due to the four-point contact, a sufficient preload cannot be applied and high rigidity cannot be obtained.</p>
<b>Load Rating</b>	
<p>Since the curvature radius of the ball raceway is 51 to 52% of the ball diameter, a large rated load can be obtained.</p>	<p>Since the curvature radius of the gothic arch groove has to be 55 to 60% of the ball diameter, the rated load is reduced to approx. 50% of that of the circular arc groove.</p>
<b>Difference in Rigidity</b>	
<p>As shown in Fig.14, the rigidity widely varies according to the difference in curvature radius or difference in preload.</p>	
<div style="display: flex; justify-content: space-around;"> <div data-bbox="82 1062 553 1401"> <p><b>Curvature radius and rigidity</b></p> <p>Comparison of rigidity by curvature (per ball)</p> </div> <div data-bbox="553 1062 1028 1401"> <p><b>Preload and deflection</b></p> <p>Displacement curve of HSR30</p> </div> </div> <p style="text-align: center;">Fig.14</p>	
<b>Difference in Service Life</b>	
<p>Since the load rating of the gothic arch groove is reduced to approx. 50% of that of the circular arc groove, the service life also decreases to 87.5%.</p>	

## [Accuracy Error of the Mounting Surface and Test Data on Rolling Resistance]

The difference between the contact structures translates into a rolling resistance.

In the gothic arch groove contact structure, each ball contacts at four points and differential slip or spinning occurs if a preload is applied to increase rigidity or an error in the mounting precision is large. This sharply increases the rolling resistance and causes abnormal wear in an early stage.

The following are test data obtained by comparing an LM Guide having the four raceway, circular-arc groove two-point contact structure and a product having the two-row, Gothic-arch, four-point contact structure.

### [Sample]

- |     |                                       |        |
|-----|---------------------------------------|--------|
| (1) | LM Guide                              |        |
|     | SR30W (self-adjusting type)           | 2 sets |
|     | HSR35A (four-way equal-load type)     | 2 sets |
| (2) | Two-row Gothic-arch groove product    |        |
|     | Type with dimensions similar to HSR30 | 2 sets |

### [Conditions]

Radial clearance:  $\pm 0\mu\text{m}$   
 Without seal  
 Without lubrication  
 Load: table mass of 30 kg

### Data 1: Preload and rolling resistance

When a preload is applied, the rolling resistance of the Gothic-arch groove product steeply increases and differential slip occurs. Even under a preload, the rolling resistance of the LM Guide does not increase.

### Data 2: Error in parallelism between two axes and rolling resistance

As shown in the Fig.15, part of the rails mounted in parallel is parallelly displaced and the rolling resistance at that point is measured.

With the Gothic-arch groove product, the rolling resistance is 34 N when the parallelistic error is 0.03 mm and 62 N when the error is 0.04 mm. These resistances are equivalent to the slip friction coefficients, indicating that the balls are in sliding contact with the groove.

Fig.15

### Data 3: Difference between the levels of the right and left rails and rolling resistance

The bottom of either rail is displaced by distance S so that there is a level difference between the two axes, and then rolling resistance is measured. If there is a level difference between the right and left rails, a moment acts on the LM block, and in the case of the Gothic-arch groove, spinning occurs. Even if the level difference between the two rails is as great as 0.3/200 mm, the LM Guide absorbs the error. This indicates that the LM Guide can operate normally even when such errors are present.

## Superb Error-Absorbing Capability with the DF Design

Since the LM Guide has a contact structure similar to the front-to-front mount of angular ball bearings, it has superb self-adjusting capability.

Angular Ball Bearings Mounted Front-to-front (DF type)

DF Type Four-row Angular Contact (LM Guide)

Angular Ball Bearings Mounted Back-to-back (DB type)

Four-row Gothic-arch Contact

An LM ball guide mounted on a plane receives a moment ( $M$ ) due to an error in flatness or in level or a deflection of the table. Therefore, it is essential for the guide to have self-adjusting capability.

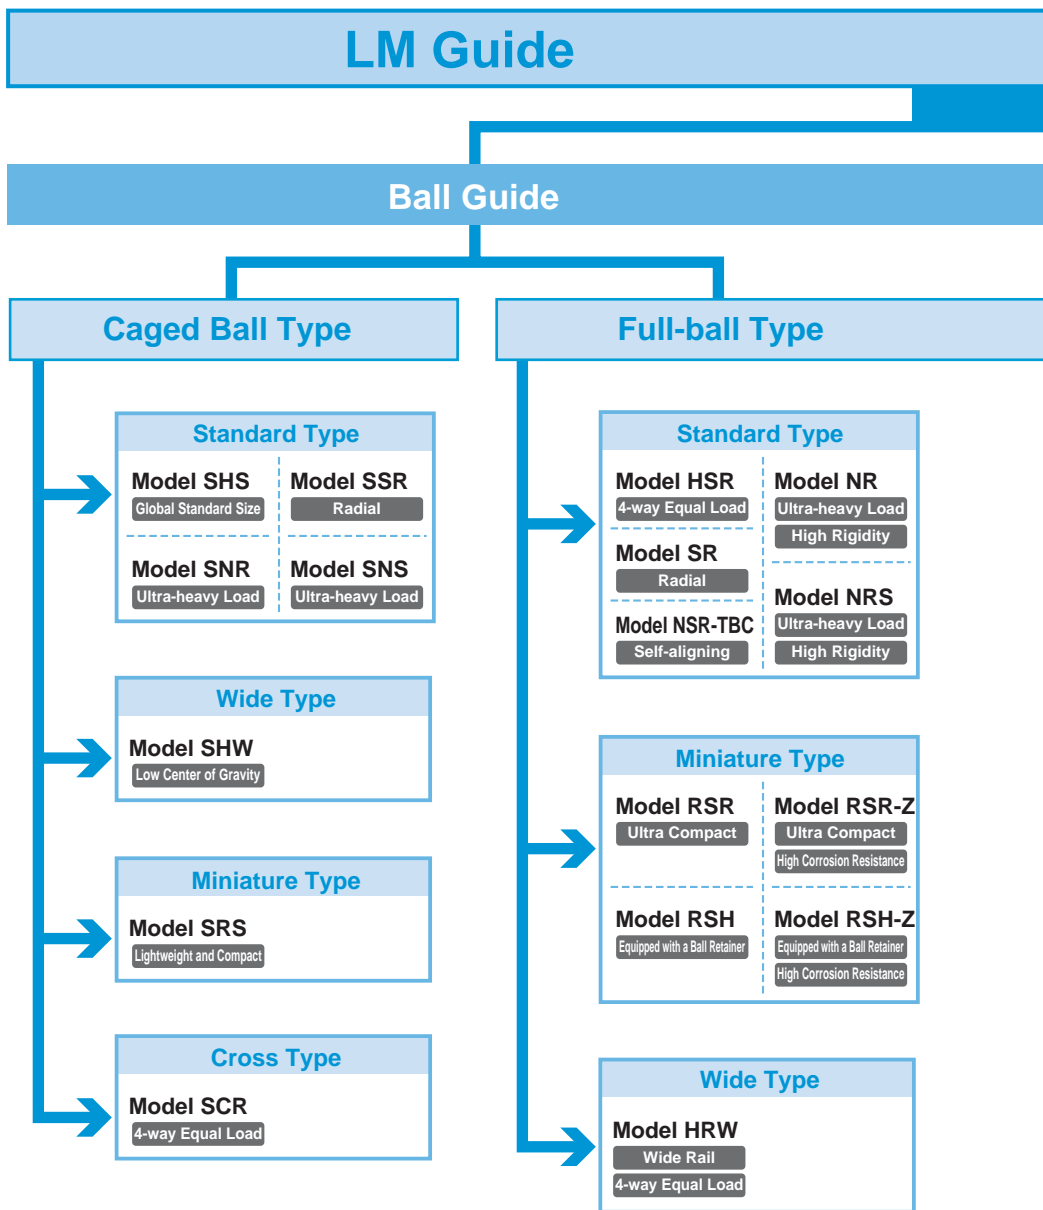

LM Guide Model HSR	Similar Product of a Competitor
<p>The diagram shows the LM Guide Model HSR mounted on a table. A moment <math>M</math> is applied to the table. The diagram illustrates how the front-to-front contact of the balls allows the guide to self-adjust to the table's surface, minimizing the internal load. Labels include 'Table', 'Mounting error', 'Deflection', and 'Distance from the application point'.</p>	<p>The diagram shows a competitor's product mounted on a block. A moment <math>M</math> is applied to the block. The diagram illustrates how the back-to-back contact of the balls results in a much larger internal load due to the table's deflection and mounting error. Labels include 'Block', 'Mounting error', 'Deflection', and 'Distance from the application point'.</p>

Since the distance from the application point of the bearing is small, the internal load generated from a mounting error is small and the self-adjusting capability is large.

Since the distance from the application point of the bearing is large, the internal load generated from a mounting error is large and the self-adjusting capability is small.

With an LM ball guide having angular ball bearings mounted back-to-back, if there is an error in flatness or a deflection in the table, the internal load applied to the block is approx. 6 times greater than that of the front-to-front mount structure and the service life is much shorter. In addition, the fluctuation in sliding resistance is greater.

# Classification Table of the LM Guides

## Roller Guide

### With a Caged Roller

#### Standard Type

**Model SRG**  
Ultra-high Rigidity

**Model SRN**  
Ultra-high Rigidity  
Low Center of Gravity

#### Wide Type

**Model SRW**  
Ultra-high Rigidity

#### Separate Type

**Model HR**  
Heavy Load

**Model GSR**  
Interchangeable, Self-aligning

**Model GSR-R**  
Interchangeable, Self-aligning  
With Rack

#### Model JR Type

**Model JR**  
Structural Member Rail  
4-way Equal Load

#### Cross Type

**Model CSR**  
4-way Equal Load

**Model MX**  
Miniature Cross

#### Special Environment Types

**Model HSR-M1**  
High Temperature  
4-way Equal Load

**Model SR-M1**  
High Temperature  
Radial

**Model HSR-M2**  
High Corrosion Resistance  
4-way Equal Load

**Model RSR-M1**  
High Temperature

#### R Guide Type

**Model HCR**

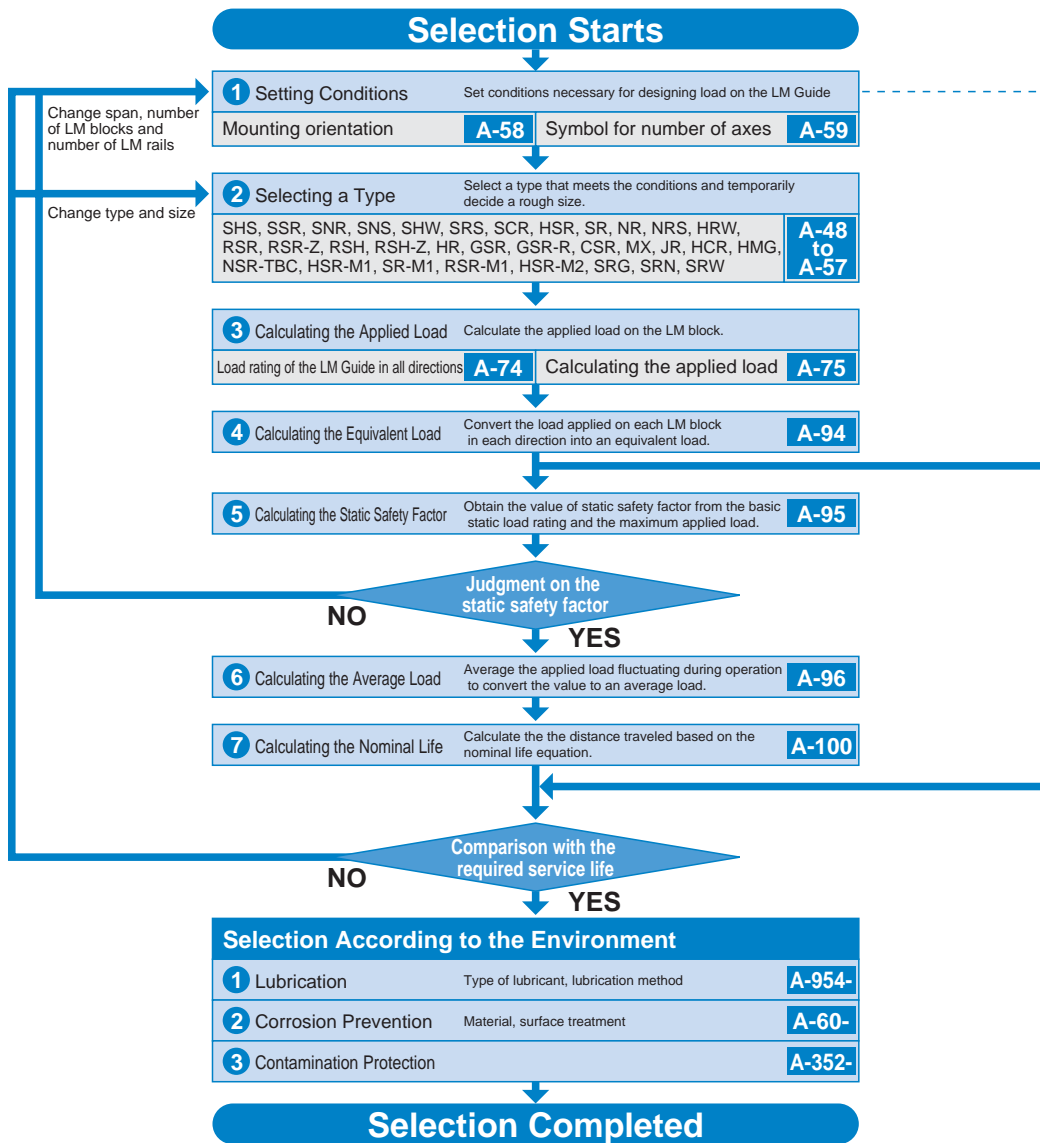

#### Straight-Curved Type

**Model HMG**

# Flowchart for Selecting an LM Guide

[Steps for Selecting an LM Guide]

The following is a flowchart as a measuring stick for selecting an LM Guide.

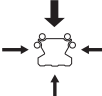

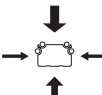

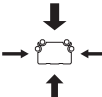

- Space in the guide section
- Dimensions (span, number of LM blocks, number of LM rails, thrust)
- Installation direction (horizontal, vertical, slant mount, wall mount, suspended)
- Magnitude, direction and position of the working load
- Operating frequency (duty cycle)
- Speed (acceleration)
- Stroke length
- Required service life
- Precision of motion
- Environment
- In a special environment (vacuum, clean room, high temperature, environment exposed to contaminated environment, etc.), it is necessary to take into account material, surface treatment, lubrication and contamination protection.

# Selecting a Type

## Types of LM Guides

THK offers a wide array of types and dimensions with LM Guides as standard so that you can select the optimal product for any application. With the unit structure of each model, you can easily obtain high running accuracy with no clearance simply by mounting the product on a plane surface with bolts. We have a proven track record and know-how in extensive applications with LM Guides.

# Setting Conditions

## Conditions of the LM Guide

### [Mounting Orientation]

The LM Guide can be mounted in the following five orientations. If oil is to be used as a lubricant, it is necessary to change the lubrication routing and the related settings. When ordering an LM Guide, please specify the mounting orientation.

### [Mounting Orientation]

Horizontal (symbol: H)	Inverted (symbol: R)	Wall mount (symbol: K)
		
Vertical (symbol: V)		Slant mount (symbol: T)
		

**[Symbol for Number of Axes]**

With the LM Guide, the normal and high-accuracy grades are interchangeable when two or more units of the LM Guide are used in combination on the same plane. However, when using two or more units of a model of precision or higher grade, or with a radial clearance of C1 or C0, specify the number of LM rails (symbol for number of axes) in advance.

(For accuracy standards and radial clearance standards, see A-118 and A-113, respectively.)

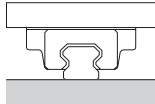

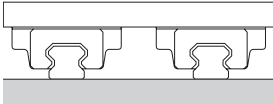

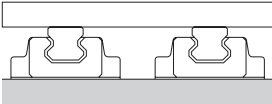

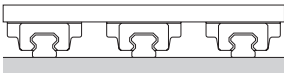

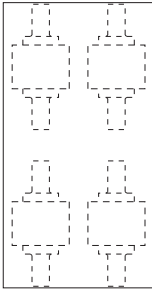

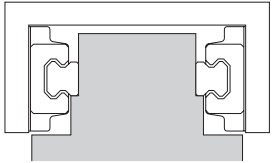

**Model number coding**

**SHS25C2SSCO+1000LP - II**

Model number (details are given on the corresponding page of the model)

## [Service environment]

### ● Lubrication

When using an LM system, it is necessary to provide effective lubrication. Without lubrication, the rolling elements or the raceway may be worn faster and the service life may be shortened.

A lubricant has effects such as the following.

- (1) Minimizes friction in moving elements to prevent seizure and reduce wear.
- (2) Forms an oil film on the raceway to decrease stress acting on the surface and extend rolling fatigue life.
- (3) Covers the metal surface to prevent rust formation.

To fully bring out an LM system's functions, it is necessary to provide lubrication according to the conditions.

Even with an LM system with seals, the internal lubricant gradually seeps out during operation. Therefore, the system needs to be lubricated at an appropriate interval according to the conditions.

### ● Corrosion Prevention

#### ■Determining a Material

Any LM system requires a material that meets the environments. For use in environments where corrosion resistance is required, some LM system models can use martensite stainless steel.

(Martensite stainless steel can be used for LM Guide models SSR, SHW, SRS, HSR, SR, HRW, RSR, RSR-Z, RSH RSH-Z and HR.)

The HSR series includes HSR-M2, a highly corrosion resistant LM Guide using austenite stainless steel, which has high anti-corrosive effect. For details, see A-292.

#### ■Surface Treatment

The surfaces of the rails and shafts of LM systems can be treated for anti-corrosive or aesthetic purposes.

THK offers THK-AP treatment, which is the optimum surface treatment for LM systems.

There are roughly three types of THK-AP treatment: AP-HC, AP-C, and AP-CF. (See A-20.)

### ● Contamination Protection

When foreign material enters an LM system, it will cause abnormal wear or shorten the service life, and it is necessary to prevent foreign material from entering the system. When entrance of dust or other foreign material is predicted, it is important to select an effective sealing device or dust-control device that meets the environment conditions.

THK offers contamination protection accessories for LM Guides by model number, such as end seals made of special synthetic rubber with high wear resistance, and side seals and inner seals for further increasing dust-prevention effect.

In addition, for locations with adverse environment, Laminated Contact Scraper LaCS and dedicated bellows are available by model number. Also, THK offers dedicated caps for LM rail mounting holes, designed to prevent cutting chips from entering the LM rail mounting holes.

When it is required to provide contamination protection for a Ball Screw in an environment exposed to cutting chips and moisture, we recommend using a telescopic cover that protects the whole system or a large bellows.

## [Special environments]

## Clean Room

In a clean environment like clean rooms, generation of dust from the LM system has to be reduced and anti-rust oil cannot be used. Therefore, it is necessary to increase the corrosion resistance of the LM system. In addition, depending on the level of cleanliness, a dust collector is required.

### Dust Generation from the LM System

#### ■ Measure to Prevent Dust Generation Resulting from Flying Grease

##### THK AFE-CA and AFF Grease

Use environmentally clean grease that produces little dust.

#### ■ Measure to Prevent Dust Generation Resulting from Metallic Abrasion Dust

##### Caged Ball LM Guide

Use the Caged Ball LM Guide, which has no friction between balls and generates little metallic abrasion dust, to allow generation of dust to be minimized.

### Corrosion Prevention

#### ■ Material-based Measure

##### Stainless Steel LM Guide

This LM Guide uses martensite stainless steel, which has an anti-corrosion effect.

##### Highly Corrosion Resistant LM Guide

It uses austenite stainless steel, which has a high anti-corrosion effect, in its LM rail.

#### ■ Measure Through Surface Treatment

##### THK AP-HC, AP-C and AP-CF Treatment

The LM system is surface treated to increase corrosion resistance.

## Vacuum

In a vacuum environment, measures to prevent gas from being emitted from a resin and grease from flying are required and anti-rust oil cannot be used. Therefore, it is necessary to select a product with high corrosion resistance.

### ■ Measure to Prevent Emission of Gas from Resin

#### Stainless Steel LM Guide

It uses stainless steel in the endplate (ball circulation unit made of resin) of the LM block to reduce emission of gas.

### ■ Measure to Prevent Grease from Evaporating

#### Vacuum Grease

If a general-purpose grease is used in a vacuum environment, oil contained in the grease evaporates and the grease loses lubricity. Therefore, use a vacuum grease that uses fluorine based oil, whose vapor pressure is low, as the base oil.

### ■ Corrosion Prevention

#### Stainless Steel LM Guide

In a vacuum environment, use a stainless steel LM Guide, which is highly corrosion resistant.

#### High Temperature LM Guide

If high temperature is predicted due to baking, use a High Temperature LM Guide, which is highly resistant to heat and corrosion.

### ■ Highly Corrosion Resistant LM Guide

This LM Guide uses austenite stainless steel, which has a high anti-corrosion effect, in the LM rail.

## High Speed

In a high speed environment, it is necessary to apply an optimum lubrication method that reduces heat generation during high speed operation and increases grease retention.

### ■ Measures to Reduce Heat Generation

#### Caged Ball LM Guide

Use of a ball cage eliminates friction between balls to reduce heat generation. In addition, grease retention is increased, thus to achieve long service life and high speed operation.

#### High Speed Ball Screw with Ball Cage

Use of a ball cage and an ideal ball recirculation structure enables fast feeding, which conventional products have not achieved.

#### THK AFG Grease

It reduces heat generation in high speed operation and has superb lubricity.

### ■ Measure to Improve Lubrication

#### QZ Lubricator

Since it supplements oil loss, the lubrication and maintenance interval can significantly be extended. It also applies the right amount of oil to the raceway, making itself an eco-friendly lubrication system that does not contaminate the surrounding area.

## High Temperature

In a high temperature environment, dimensional alteration caused by heat is problematic. Use a High Temperature LM Guide, which is heat resistant and whose dimensions little change after being heated, and a high temperature grease.

### Heat Resistance

#### High Temperature LM Guide

It is an LM Guide that is highly resistant to heat and whose dimensions little change after being heated and cooled.

### Grease

#### High Temperature Grease

Use a high temperature grease with which the rolling resistance of the LM system little fluctuates even temperature changes from a normal to high range.

## High Temperature LM Guide

HSR-M1 SR-M1 RSR-M1

## High Temperature Grease

## Low Temperature

Use an LM system whose resin component are little affected by low temperature, as a measure to increase corrosion resistance in transition from normal to low temperature, and a grease with a low rolling resistance fluctuation even at low temperature.

### Impact of Low Temperature on Resin Components

#### Stainless Steel LM Guide

The endplate (ball circulation path normally made of resin) of the LM block is made of stainless steel.

### Corrosion Prevention

Provide surface treatment to the LM system to increase its corrosion resistance.

### Grease

Use THK AFC Grease, with which the rolling resistance of the system little fluctuates even at low temperature.

## Stainless Steel LM Guide

SSR SHW SRS HSR SR  
HRW HR RSR RSH

## Surface Treatment

## Grease

## Micro Motion

Micro strokes cause oil film break and poor lubrication, resulting in early wear. In such cases, select a grease with which the oil film strength is high and an oil film can easily be formed.

### Grease

#### THK AFC Grease

AFC Grease is a urea-based grease that excels in oil film strength and wear resistance.

## Grease

## Foreign Matter

If foreign matter enters the LM system, it will cause abnormal wear and shorten the service life. Therefore, it is necessary to prevent such entrance of foreign matter.

Especially in an environment containing minute foreign matter or a water-soluble coolant that a telescopic cover or a bellows cannot remove, it is necessary to attach a contamination protection accessory capable of efficiently removing foreign matter.

### ■ Metal Scraper

It is used to remove relatively large foreign objects such as cutting chips, spatter and sand or hard foreign matter that adhere to the LM rail.

### ■ Laminated Contact Scraper LaCS

Unlike a metal scraper, it removes foreign matter while it is in contact with the LM rail. Therefore, it demonstrates a high contamination protection effect against minute foreign matter, which has been difficult to remove with conventional metal scrapers.

### ■ QZ Lubricator

QZ Lubricator is a lubrication system that feeds the right amount of lubricant by closely contacting its highly oil-impregnated fiber net to the ball raceway.

## Calculating the Applied Load

The LM Guide is capable of receiving loads and moments in all directions that are generated due to the mounting orientation, alignment, gravity center position of a traveling object, thrust position and cutting resistance.

Fig.1 Directions of the Loads Applied on the LM Guide

## Rated Load of an LM Guide in Each Direction

The LM Guide is categorized into roughly two types: the 4-way equal load type, which has the same rated load in the radial, reverse radial and lateral directions, and the radial type, which has a large rated load in the radial direction. With the radial type LM Guide, the rated load in the radial direction is different from that in the reverse radial and lateral directions. When such loads are applied, multiply the basic load rating by the corresponding factor. Those factors are specified in the respective sections.

### [Rated Loads in All Directions]

Type	Load Distribution Curve
<p><b>4-way Equal Load Type</b></p>	
<p><b>Radial Type</b></p>	

## Calculating an Applied Load

### [Single-Axis Use]

#### ● Moment Equivalence

When the installation space for the LM Guide is limited, you may have to use only one LM block, or double LM blocks closely contacting with each other. In such a setting, the load distribution is not uniform and, as a result, an excessive load is applied in localized areas (i.e., both ends) as shown in Fig.2. Continued use under such conditions may result in flaking in those areas, consequently shortening the service life. In such a case, calculate the actual load by multiplying the moment value by any one of the equivalent-moment factors specified in Table1 to Table9.

Fig.2 Ball Load when a Moment is Applied

An equivalent-load equation applicable when a moment acts on an LM Guide is shown below.

$$P = K \cdot M$$

P : Equivalent load per LM Guide (N)

K : Equivalent moment factor

M : Applied moment (N-mm)

● **Equivalent Factor**

Since the rated load is equivalent to the permissible moment, the equivalent factor to be multiplied when equalizing the  $M_A$ ,  $M_B$  and  $M_C$  moments to the applied load per block is obtained by dividing the rated loads in the corresponding directions.

With those models other than 4-way equal load types, however, the load ratings in the 4 directions differ from each other. Therefore, the equivalent factor values for the  $M_A$  and  $M_C$  moments also differ depending on whether the direction is radial or reverse radial.

■ **Equivalent Factors for the  $M_A$  Moment**

Fig.3 Equivalent Factors for the  $M_A$  Moment

Equivalent factors for the  $M_A$  Moment

- Equivalent factor in the radial direction  $K_{AR} = \frac{C_0}{M_A}$
- Equivalent factor in the reverse radial direction  $K_{AL} = \frac{C_{0L}}{M_A}$

$$\frac{C_0}{K_{AR} \cdot M_A} = \frac{C_{0L}}{K_{AL} \cdot M_A} = 1$$

■ **Equivalent Factors for the  $M_B$  Moment**

Fig.4 Equivalent Factors for the  $M_B$  Moment

Equivalent factors for the  $M_B$  Moment

- Equivalent factor in the lateral directions  $K_B = \frac{C_{0T}}{M_B}$

$$\frac{C_{0T}}{K_B \cdot M_B} = 1$$

## ■ Equivalent Factors for the $M_c$ Moment

Fig.5 Equivalent Factors for the  $M_c$  Moment

Equivalent factors for the  $M_c$  Moment

Equivalent factor in the radial direction	$K_{CR} = \frac{C_0}{M_c}$
Equivalent factor in the reverse radial direction	$K_{CL} = \frac{C_{0L}}{M_c}$

$$\frac{C_0}{K_{CR} \cdot M_c} = \frac{C_{0L}}{K_{CL} \cdot M_c} = 1$$

$C_0$	: Basic static load rating (radial direction)	(N)
$C_{0L}$	: Basic static load rating (reverse radial direction)	(N)
$C_{0T}$	: Basic static load rating (lateral direction)	(N)
$P_R$	: Calculated load (radial direction)	(N)
$P_L$	: Calculated load (reverse radial direction)	(N)
$P_T$	: Calculated load (lateral direction)	(N)

$K_{AR1}$  : Equivalent factor in the  $M_A$  radial direction when one LM block is used

$K_{AL1}$  : Equivalent factor in the  $M_A$  reverse radial direction when one LM block is used

$K_{AR2}$  : Equivalent factor in the  $M_A$  radial direction when two LM blocks are used in close contact with each other

$K_{AL2}$  : Equivalent factor in the  $M_A$  reverse radial direction when two LM blocks are used in close contact with each other

$K_{B1}$  :  $M_B$  Equivalent factor when one LM block is used

$K_{B2}$  :  $M_B$  Equivalent factor when two LM blocks are used in close contact with each other

$K_{CR}$  : Equivalent factor in the  $M_C$  radial direction

$K_{CL}$  : Equivalent factor in the  $M_C$  reverse radial direction

**[Example of calculation]**

**When one LM block is used**

Model No.: SSR20XV1

Gravitational acceleration  $g=9.8$  (m/s<sup>2</sup>)  
 Mass  $m=10$  (kg)  
 $l_1=200$  (mm)  
 $l_2=100$  (mm)

Fig.6 When One LM Block is Used

- No.1  $P_1=mg+K_{AR1} \cdot mg \cdot l_1+K_{CR} \cdot mg \cdot l_2=98+0.275 \times 98 \times 200+0.129 \times 98 \times 100=6752$  (N)
- No.2  $P_2=mg-K_{AL1} \cdot mg \cdot l_1+K_{CR} \cdot mg \cdot l_2=98-0.137 \times 98 \times 200+0.129 \times 98 \times 100=-1323$  (N)
- No.3  $P_3=mg-K_{AL1} \cdot mg \cdot l_1-K_{CL} \cdot mg \cdot l_2=98-0.137 \times 98 \times 200-0.0644 \times 98 \times 100=-3218$  (N)
- No.4  $P_4=mg+K_{AR1} \cdot mg \cdot l_1-K_{CL} \cdot mg \cdot l_2=98+0.275 \times 98 \times 200-0.0644 \times 98 \times 100=4857$  (N)

**When two LM blocks are used in close contact with each other**

Model No.: SNS30R2

Gravitational acceleration  $g=9.8$  (m/s<sup>2</sup>)  
 Mass  $m=5$  (kg)  
 $l_1=200$  (mm)  
 $l_2=150$  (mm)

Fig.7 When Two LM Blocks are Used in Close Contact with Each Other

- No.1  $P_1=\frac{mg}{2}+K_{AR2} \cdot mg \cdot l_1+K_{CR} \cdot \frac{mg \cdot l_2}{2}=\frac{49}{2}+0.018 \times 49 \times 200+0.0842 \times \frac{49 \times 150}{2}=510.3$  (N)
- No.2  $P_2=\frac{mg}{2}-K_{AL2} \cdot mg \cdot l_1+K_{CR} \cdot \frac{mg \cdot l_2}{2}=\frac{49}{2}-0.0151 \times 49 \times 200+0.0842 \times \frac{49 \times 150}{2}=186$  (N)
- No.3  $P_3=\frac{mg}{2}-K_{AL2} \cdot mg \cdot l_1-K_{CL} \cdot \frac{mg \cdot l_2}{2}=\frac{49}{2}-0.0151 \times 49 \times 200-0.0707 \times \frac{49 \times 150}{2}=-383.3$  (N)
- No.4  $P_4=\frac{mg}{2}+K_{AR2} \cdot mg \cdot l_1-K_{CL} \cdot \frac{mg \cdot l_2}{2}=\frac{49}{2}+0.018 \times 49 \times 200-0.0707 \times \frac{49 \times 150}{2}=-58.9$  (N)

Note1) Since an LM Guide used in vertical installation receives only a moment load, there is no need to apply a load force (mg).  
 Note2) In some models, load ratings differ depending on the direction of the applied load. With such a model, calculate an equivalent load in the direction of the smallest load rating.

**[Double-axis Use]****● Setting Conditions**

Set the conditions needed to calculate the LM system's applied load and service life in hours.

The conditions consist of the following items.

- (1) Mass:  $m$  (kg)
- (2) Direction of the working load
- (3) Position of the working point (e.g., center of gravity):  $l_2, l_3, h_1$ (mm)
- (4) Thrust position:  $l_4, h_2$ (mm)
- (5) LM system arrangement:  $l_0, l_1$ (mm)  
(No. of units and axes)
- (6) Velocity diagram  
Speed:  $V$  (mm/s)  
Time constant:  $t_n$  (s)  
Acceleration:  $\alpha_n$ (mm/s<sup>2</sup>)

$$(\alpha_n = \frac{V}{t_n})$$

- (7) Duty cycle  
Number of reciprocations per minute:  $N_1$ (min<sup>-1</sup>)
- (8) Stroke length:  $l_s$ (mm)
- (9) Average speed:  $V_m$ (m/s)
- (10) Required service life in hours:  $L_h$ (h)

Gravitational acceleration  $g=9.8$  (m/s<sup>2</sup>)

Fig.8 Condition

● Applied Load Equation

The load applied to the LM Guide varies with the external force, such as the position of the gravity center of an object, thrust position, inertia generated from acceleration/deceleration during start or stop, and cutting force.

In selecting an LM Guide, it is necessary to obtain the value of the applied load while taking into account these conditions.

Calculate the load applied to the LM Guide in each of the examples 1 to 10 shown below.

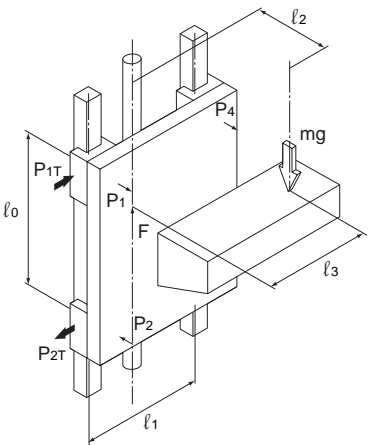

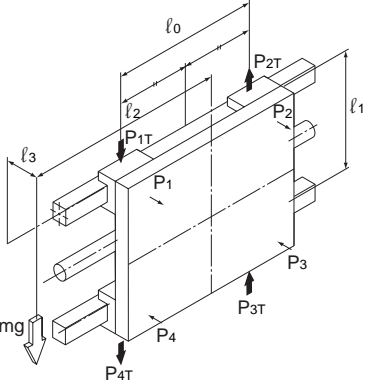

- m : Mass (kg)
- l<sub>n</sub> : Distance (mm)
- F<sub>n</sub> : External force (N)
- P<sub>n</sub> : Applied load (radial/reverse radial direction) (N)
- P<sub>nr</sub> : Applied load (lateral directions) (N)
- g : Gravitational acceleration (m/s<sup>2</sup>)  
(g = 9.8m/s<sup>2</sup>)
- V : Speed (m/s)
- t<sub>n</sub> : Time constant (s)
- α<sub>n</sub> : Acceleration (m/s<sup>2</sup>)

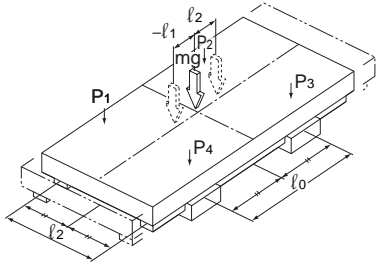

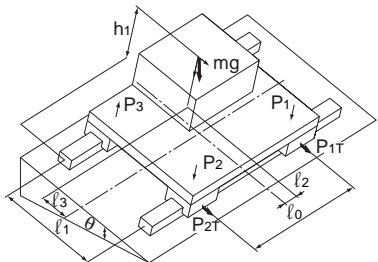

$$(\alpha_n = \frac{V}{t_n})$$

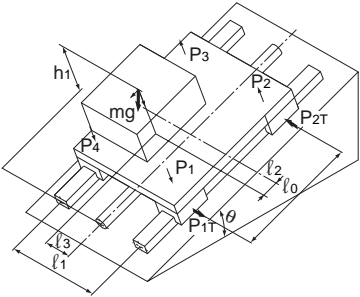

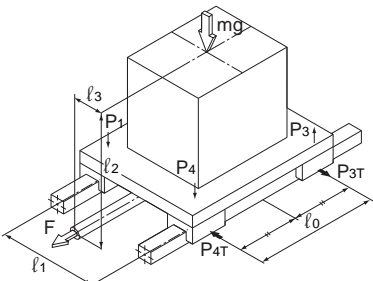

[Example]

	Condition	Applied Load Equation
1	<p>Horizontal mount (with the block traveling) Uniform motion or dwell</p>	$P_1 = \frac{mg}{4} + \frac{mg \cdot l_2}{2 \cdot l_0} - \frac{mg \cdot l_3}{2 \cdot l_1}$ $P_2 = \frac{mg}{4} - \frac{mg \cdot l_2}{2 \cdot l_0} - \frac{mg \cdot l_3}{2 \cdot l_1}$ $P_3 = \frac{mg}{4} - \frac{mg \cdot l_2}{2 \cdot l_0} + \frac{mg \cdot l_3}{2 \cdot l_1}$ $P_4 = \frac{mg}{4} + \frac{mg \cdot l_2}{2 \cdot l_0} + \frac{mg \cdot l_3}{2 \cdot l_1}$
2	<p>Horizontal mount, overhung (with the block traveling) Uniform motion or dwell</p>	$P_1 = \frac{mg}{4} + \frac{mg \cdot l_2}{2 \cdot l_0} + \frac{mg \cdot l_3}{2 \cdot l_1}$ $P_2 = \frac{mg}{4} - \frac{mg \cdot l_2}{2 \cdot l_0} + \frac{mg \cdot l_3}{2 \cdot l_1}$ $P_3 = \frac{mg}{4} - \frac{mg \cdot l_2}{2 \cdot l_0} - \frac{mg \cdot l_3}{2 \cdot l_1}$ $P_4 = \frac{mg}{4} + \frac{mg \cdot l_2}{2 \cdot l_0} - \frac{mg \cdot l_3}{2 \cdot l_1}$

	Condition	Applied Load Equation

## Calculating the Equivalent Load

The LM Guide can bear loads and moments in all directions, including a radial load ( $P_R$ ), reverse radial load ( $P_L$ ) and lateral loads ( $P_T$ ), simultaneously.

Applied loads include the following.

$P_R$ : Radial load

$P_L$ : Reverse-radial load

$P_T$ : Lateral load

Fig.9 Directions of the Loads Applied on the LM Guide

### [Equivalent Load $P_\epsilon$ ]

When two or more loads (e.g., radial load and lateral load) are simultaneously applied to the LM Guide, the service life and the static safety factor are calculated using equivalent load values obtained by converting all the loads into radial, lateral and other loads.

### [Equivalent Load Equation]

The equivalent load equation for the LM Guide differs by model. For details, see the section corresponding to the subject model.

#### Example of equation for LM Guide model HSR

The equivalent load when a radial load ( $P_R$ ) and a lateral load ( $P_T$ ) are applied simultaneously is obtained using the following equation.

$$P_\epsilon(\text{equivalent load}) = P_R + P_T$$

$P_R$ : Radial load

$P_T$ : Lateral load

Fig.10 Equivalent of Load of the LM Guide

## Calculating the Static Safety Factor

To calculate a load applied to the LM Guide, the average load required for calculating the service life and the maximum load needed for calculating the static safety factor must be obtained first. In a system subject to frequent starts and stops, placed under cutting forces or under a large moment caused by an overhang load, an excessively large load may apply to the LM Guide. When selecting a model number, make sure that the desired model is capable of receiving the required maximum load (whether stationary or in motion). Table10 shows standard values for the static safety factor.

Table10 Reference Value of Static Safety Factors ( $f_s$ )

Machine using the LM Guide	Load conditions	Lower limit of $f_s$
General industrial machinery	Without vibration or impact	1 to 1.3
	With vibration or impact	2 to 3
Machine tool	Without vibration or impact	1 to 1.5
	With vibration or impact	2.5 to 7

When the radial load is large	$\frac{f_H \cdot f_T \cdot f_C \cdot C_0}{P_R} \geq f_s$
When the reverse radial load is large	$\frac{f_H \cdot f_T \cdot f_C \cdot C_{0L}}{P_L} \geq f_s$
When the lateral loads are large	$\frac{f_H \cdot f_T \cdot f_C \cdot C_{0T}}{P_T} \geq f_s$

- $f_s$  : Static safety factor
- $C_0$  : Basic static load rating (N)  
(radial direction)
- $C_{0L}$  : Basic static load rating (N)  
(reverse-radial direction)
- $C_{0T}$  : Basic static load rating (N)  
(lateral direction)
- $P_R$  : Calculated load (radial direction) (N)
- $P_L$  : Calculated load (N)  
(reverse-radial direction)
- $P_T$  : Calculated load (lateral direction) (N)
- $f_H$  : Hardness factor (see Fig.11 on A-101)
- $f_T$  : Temperature factor (see Fig.12 on A-101)
- $f_C$  : Contact factor (see Table11 on A-101)

## Calculating the Average Load

In cases where the load applied to each LM block fluctuates under different conditions, such as an industrial robot holding a work with its arm as it advances and receding with its arm empty, and a machine tool handling various workpieces, it is necessary to calculate the service life of the LM Block while taking into account such fluctuating loading conditions.

The average load ( $P_m$ ) is the load under which the service life of the LM Guide is equivalent to that under varying loads applied to the LM blocks.

$$P_m = \sqrt[3]{\frac{1}{L} \cdot \sum_{n=1}^n (P_n^3 \cdot L_n)}$$

- $P_m$  : Average load (N)
- $P_n$  : Varying load (N)
- $L$  : Total travel distance (mm)
- $L_n$  : Distance traveled under load  $P_n$  (mm)

Note) The above equation or the equation (1) below applies when the rolling elements are balls.

(1) When the load fluctuates stepwise

$$P_m = \sqrt[3]{\frac{1}{L} (P_1^3 \cdot L_1 + P_2^3 \cdot L_2 + \dots + P_n^3 \cdot L_n)} \dots\dots\dots(1)$$

- $P_m$  : Average load (N)
- $P_n$  : Varying load (N)
- $L$  : Total travel distance (mm)
- $L_n$  : Distance traveled under  $P_n$  (mm)

(2) When the load fluctuates monotonically

$$P_m \doteq \frac{1}{3} (P_{min} + 2 \cdot P_{max}) \dots\dots\dots (2)$$

$P_{min}$  : Minimum load (N)

$P_{max}$  : Maximum load (N)

(3) When the load fluctuates sinusoidally

(a)  $P_m \doteq 0.65P_{max} \dots\dots\dots (3)$

(b)  $P_m \doteq 0.75P_{max} \dots\dots\dots (4)$

## Example of Calculating the Average Load (1) - with Horizontal Mount and Acceleration/Deceleration Considered

### [Conditions]

$$\alpha_1 = \frac{v}{t_1} \text{ (m/s}^2\text{)}$$

### [Load Applied to the LM Block]

#### ● During uniform motion

$$P_1 = + \frac{mg}{4}$$

$$P_2 = + \frac{mg}{4}$$

$$P_3 = + \frac{mg}{4}$$

$$P_4 = + \frac{mg}{4}$$

#### ● During acceleration

$$Pa_1 = P_1 + \frac{m \cdot \alpha_1 \cdot l_2}{2 \cdot l_0}$$

$$Pa_2 = P_2 - \frac{m \cdot \alpha_1 \cdot l_2}{2 \cdot l_0}$$

$$Pa_3 = P_3 - \frac{m \cdot \alpha_1 \cdot l_2}{2 \cdot l_0}$$

$$Pa_4 = P_4 + \frac{m \cdot \alpha_1 \cdot l_2}{2 \cdot l_0}$$

#### ● During deceleration

$$Pd_1 = P_1 - \frac{m \cdot \alpha_1 \cdot l_2}{2 \cdot l_0}$$

$$Pd_2 = P_2 + \frac{m \cdot \alpha_1 \cdot l_2}{2 \cdot l_0}$$

$$Pd_3 = P_3 + \frac{m \cdot \alpha_1 \cdot l_2}{2 \cdot l_0}$$

$$Pd_4 = P_4 - \frac{m \cdot \alpha_1 \cdot l_2}{2 \cdot l_0}$$

### [Average load]

$$P_{m1} = \sqrt[3]{\frac{1}{l_s} (Pa_1^3 \cdot s_1 + P_1^3 \cdot s_2 + Pd_1^3 \cdot s_3)}$$

$$P_{m2} = \sqrt[3]{\frac{1}{l_s} (Pa_2^3 \cdot s_1 + P_2^3 \cdot s_2 + Pd_2^3 \cdot s_3)}$$

$$P_{m3} = \sqrt[3]{\frac{1}{l_s} (Pa_3^3 \cdot s_1 + P_3^3 \cdot s_2 + Pd_3^3 \cdot s_3)}$$

$$P_{m4} = \sqrt[3]{\frac{1}{l_s} (Pa_4^3 \cdot s_1 + P_4^3 \cdot s_2 + Pd_4^3 \cdot s_3)}$$

(Note)  $Pa_n$  and  $Pd_n$  represent loads applied to each LM block. The suffix "n" indicates the block number in the diagram above.

## Example of Calculating the Average Load (2) - When the Rails are Movable

**[Conditions]**

**[Load Applied to the LM Block]**

● **At the left of the arm**

$$P_{r1} = + \frac{mg}{4} + \frac{mg \cdot l_1}{2 \cdot l_0}$$

$$P_{r2} = + \frac{mg}{4} - \frac{mg \cdot l_1}{2 \cdot l_0}$$

$$P_{r3} = + \frac{mg}{4} - \frac{mg \cdot l_1}{2 \cdot l_0}$$

$$P_{r4} = + \frac{mg}{4} + \frac{mg \cdot l_1}{2 \cdot l_0}$$

● **At the right of the arm**

$$P_{r1} = + \frac{mg}{4} - \frac{mg \cdot l_2}{2 \cdot l_0}$$

$$P_{r2} = + \frac{mg}{4} + \frac{mg \cdot l_2}{2 \cdot l_0}$$

$$P_{r3} = + \frac{mg}{4} + \frac{mg \cdot l_2}{2 \cdot l_0}$$

$$P_{r4} = + \frac{mg}{4} - \frac{mg \cdot l_2}{2 \cdot l_0}$$

**[Average load]**

$$P_{m1} = \frac{1}{3} (2 \cdot |P_{r1}| + |P_{r1}|)$$

$$P_{m2} = \frac{1}{3} (2 \cdot |P_{r2}| + |P_{r2}|)$$

$$P_{m3} = \frac{1}{3} (2 \cdot |P_{r3}| + |P_{r3}|)$$

$$P_{m4} = \frac{1}{3} (2 \cdot |P_{r4}| + |P_{r4}|)$$

Note)  $P_{rn}$  and  $P_{rn}$  represent loads applied to each LM block. The suffix "n" indicates the block number in the diagram above.

## Calculating the Nominal Life

The service life of an LM Guide is subject to variations even under the same operational conditions. Therefore, it is necessary to use the nominal life defined below as a reference value for obtaining the service life of the LM Guide. The nominal life means the total travel distance that 90% of a group of units of the same LM Guide model can achieve without flaking (scale-like pieces on the metal surface) after individually running under the same conditions.

### Nominal Life Equation for an LM Guide Using Balls

$$L = \left( \frac{f_H \cdot f_T \cdot f_C}{f_W} \cdot \frac{C}{P_C} \right)^3 \times 50$$

- L : Nominal life (km)  
 C : Basic dynamic load rating (N)  
 P<sub>C</sub> : Calculated load (N)  
 f<sub>H</sub> : Hardness factor (see Fig.11 on A-101)  
 f<sub>T</sub> : Temperature factor (see Fig.12 on A-101)  
 f<sub>C</sub> : Contact factor (see Table11 on A-101)  
 f<sub>W</sub> : Load factor (see Table12 on A-102)

### Rated Life Equation for an LM Guide Using Rollers

$$L = \left( \frac{f_H \cdot f_T \cdot f_C}{f_W} \cdot \frac{C}{P_C} \right)^{\frac{10}{3}} \times 100$$

- L : Nominal life (km)  
 C : Basic dynamic load rating (N)  
 P<sub>C</sub> : Calculated load (N)  
 f<sub>H</sub> : Hardness factor (see Fig.11 on A-101)  
 f<sub>T</sub> : Temperature factor (see Fig.12 on A-101)  
 f<sub>C</sub> : Contact factor (see Table11 on A-101)  
 f<sub>W</sub> : Load factor (see Table12 on A-102)

Once the nominal life (L) has been obtained, the service life time can be obtained using the following equation if the stroke length and the number reciprocations are constant.

$$L_h = \frac{L \times 10^6}{2 \times l_s \times n_1 \times 60}$$

- L<sub>h</sub> : Service life time (h)  
 l<sub>s</sub> : Stroke length (mm)  
 n<sub>1</sub> : Number of reciprocations per minute (min<sup>-1</sup>)

**[f<sub>H</sub>: Hardness Factor]**

To ensure the achievement of the optimum load capacity of the LM Guide, the raceway hardness must be between 58 and 64 HRC.

If the hardness is lower than this range, the basic dynamic load rating and the basic static load rating decrease. Therefore, it is necessary to multiply each rating by the respective hardness factor (f<sub>H</sub>).

Since the LM Guide has sufficient hardness, the f<sub>H</sub> value for the LM Guide is normally 1.0 unless otherwise specified.

Fig.11 Hardness Factor (f<sub>H</sub>)

**[f<sub>T</sub>:Temperature Factor]**

If the temperature of the environment surrounding the operating LM Guide exceeds 100°C, take into account the adverse effect of the high temperature and multiply the basic load ratings by the temperature factor indicated in Fig.12.

In addition, the selected LM Guide must also be of a high temperature type.

Note) The LM Guide is designed to normally be used at environment temperature of 80°C or less.

Fig.12 Temperature Factor (f<sub>T</sub>)

**[f<sub>c</sub>: Contact Factor]**

When multiple LM blocks are used in close contact with each other, it is difficult to achieve uniform load distribution due to moment loads and mounting-surface accuracy. When using multiple blocks in close contact with each other, multiply the basic load rating (C or C<sub>0</sub>) by the corresponding contact factor indicated in Table11.

Note) If uneven load distribution is expected in a large machine, take into account the respective contact factor indicated in Table11.

Table11 Contact Factor (f<sub>c</sub>)

Number of blocks used in close contact	Contact factor f <sub>c</sub>
2	0.81
3	0.72
4	0.66
5	0.61
6 or greater	0.6
Normal use	1

**[ $f_w$ : Load Factor]**

In general, reciprocating machines tend to involve vibrations or impact during operation. It is extremely difficult to accurately determine vibrations generated during high-speed operation and impact during frequent start and stop. Therefore, where the effects of speed and vibration are estimated to be significant, divide the basic dynamic load rating (C) by a load factor selected from Table12, which contains empirically obtained data.

Table12 Load Factor ( $f_w$ )

Vibrations/ impact	Speed(V)	$f_w$
Faint	Very low $V \leq 0.25\text{m/s}$	1 to 1.2
Weak	Slow $0.25 < V \leq 1\text{m/s}$	1.2 to 1.5
Medium	Medium $1 < V \leq 2\text{m/s}$	1.5 to 2
Strong	High $V > 2\text{m/s}$	2 to 3.5

## Example of Calculating the Nominal Life (1) - with Horizontal Mount and High-speed Acceleration

[Conditions]

Model No.	: HSR35LA2SS+2500LP- II	
	(basic dynamic load rating: $C = 50.2$ kN)	
	(basic static load rating: $C_0 = 81.4$ kN)	
Mass	$m_1 = 800$ kg	Distance : $l_0 = 600$ mm
	$m_2 = 500$ kg	$l_1 = 400$ mm
Speed	: $V = 0.5$ m/s	$l_2 = 120$ mm
Time	: $t_1 = 0.05$ s	$l_3 = 50$ mm
	$t_2 = 2.8$ s	$l_4 = 200$ mm
	$t_3 = 0.15$ s	$l_5 = 350$ mm
Acceleration	: $\alpha_1 = 10$ m/s <sup>2</sup>	
	$\alpha_3 = 3.333$ m/s <sup>2</sup>	
Stroke	: $l_s = 1450$ mm	

Gravitational acceleration  $g = 9.8$  (m/s<sup>2</sup>)

Fig.13 Condition

**[Load Applied to the LM Block]**

Calculate the load applied to each LM block.

**● During uniform motion****■ Applied load in the radial direction  $P_r$** 

$$P_1 = + \frac{m_1 g}{4} - \frac{m_1 g \cdot l_2}{2 \cdot l_0} + \frac{m_1 g \cdot l_3}{2 \cdot l_1} + \frac{m_2 g}{4} = +2891 \text{ N}$$

$$P_2 = + \frac{m_1 g}{4} + \frac{m_1 g \cdot l_2}{2 \cdot l_0} + \frac{m_1 g \cdot l_3}{2 \cdot l_1} + \frac{m_2 g}{4} = +4459 \text{ N}$$

$$P_3 = + \frac{m_1 g}{4} + \frac{m_1 g \cdot l_2}{2 \cdot l_0} - \frac{m_1 g \cdot l_3}{2 \cdot l_1} + \frac{m_2 g}{4} = +3479 \text{ N}$$

$$P_4 = + \frac{m_1 g}{4} - \frac{m_1 g \cdot l_2}{2 \cdot l_0} - \frac{m_1 g \cdot l_3}{2 \cdot l_1} + \frac{m_2 g}{4} = +1911 \text{ N}$$

**● During leftward acceleration****■ Applied load in the radial direction  $P'_{ra}$** 

$$P'_{ra1} = P_1 - \frac{m_1 \cdot \alpha_1 \cdot l_5}{2 \cdot l_0} - \frac{m_2 \cdot \alpha_1 \cdot l_4}{2 \cdot l_0} = - 275.6 \text{ N}$$

$$P'_{ra2} = P_2 + \frac{m_1 \cdot \alpha_1 \cdot l_5}{2 \cdot l_0} + \frac{m_2 \cdot \alpha_1 \cdot l_4}{2 \cdot l_0} = + 7625.6 \text{ N}$$

$$P'_{ra3} = P_3 + \frac{m_1 \cdot \alpha_1 \cdot l_5}{2 \cdot l_0} + \frac{m_2 \cdot \alpha_1 \cdot l_4}{2 \cdot l_0} = + 6645.6 \text{ N}$$

$$P'_{ra4} = P_4 - \frac{m_1 \cdot \alpha_1 \cdot l_5}{2 \cdot l_0} - \frac{m_2 \cdot \alpha_1 \cdot l_4}{2 \cdot l_0} = - 1255.6 \text{ N}$$

**■ Applied load in the lateral direction  $P't_{la}$** 

$$P't_{la1} = - \frac{m_1 \cdot \alpha_1 \cdot l_3}{2 \cdot l_0} = - 333.3 \text{ N}$$

$$P't_{la2} = + \frac{m_1 \cdot \alpha_1 \cdot l_3}{2 \cdot l_0} = + 333.3 \text{ N}$$

$$P't_{la3} = + \frac{m_1 \cdot \alpha_1 \cdot l_3}{2 \cdot l_0} = + 333.3 \text{ N}$$

$$P't_{la4} = - \frac{m_1 \cdot \alpha_1 \cdot l_3}{2 \cdot l_0} = - 333.3 \text{ N}$$

**● During leftward deceleration****■ Applied load in the radial direction  $P'_{rd}$** 

$$P'_{rd1} = P_1 + \frac{m_1 \cdot \alpha_3 \cdot l_5}{2 \cdot l_0} + \frac{m_2 \cdot \alpha_3 \cdot l_4}{2 \cdot l_0} = + 3946.6 \text{ N}$$

$$P'_{rd2} = P_2 - \frac{m_1 \cdot \alpha_3 \cdot l_5}{2 \cdot l_0} - \frac{m_2 \cdot \alpha_3 \cdot l_4}{2 \cdot l_0} = + 3403.4 \text{ N}$$

$$P'_{rd3} = P_3 - \frac{m_1 \cdot \alpha_3 \cdot l_5}{2 \cdot l_0} - \frac{m_2 \cdot \alpha_3 \cdot l_4}{2 \cdot l_0} = + 2423.4 \text{ N}$$

$$P'_{rd4} = P_4 + \frac{m_1 \cdot \alpha_3 \cdot l_5}{2 \cdot l_0} + \frac{m_2 \cdot \alpha_3 \cdot l_4}{2 \cdot l_0} = + 2966.6 \text{ N}$$

■ **Applied load in the lateral direction P<sub>tl</sub>d<sub>n</sub>**

$$P_{tl}d_1 = + \frac{m_1 \cdot \alpha_3 \cdot l_3}{2 \cdot l_0} = + 111.1 \text{ N}$$

$$P_{tl}d_2 = - \frac{m_1 \cdot \alpha_3 \cdot l_3}{2 \cdot l_0} = - 111.1 \text{ N}$$

$$P_{tl}d_3 = - \frac{m_1 \cdot \alpha_3 \cdot l_3}{2 \cdot l_0} = - 111.1 \text{ N}$$

$$P_{tl}d_4 = + \frac{m_1 \cdot \alpha_3 \cdot l_3}{2 \cdot l_0} = + 111.1 \text{ N}$$

● **During rightward acceleration**

■ **Applied load in the radial direction P<sub>ra</sub><sub>n</sub>**

$$P_{ra_1} = P_1 + \frac{m_1 \cdot \alpha_1 \cdot l_5}{2 \cdot l_0} + \frac{m_2 \cdot \alpha_1 \cdot l_4}{2 \cdot l_0} = +6057.6 \text{ N}$$

$$P_{ra_2} = P_2 - \frac{m_1 \cdot \alpha_1 \cdot l_5}{2 \cdot l_0} - \frac{m_2 \cdot \alpha_1 \cdot l_4}{2 \cdot l_0} = +1292.4 \text{ N}$$

$$P_{ra_3} = P_3 - \frac{m_1 \cdot \alpha_1 \cdot l_5}{2 \cdot l_0} - \frac{m_2 \cdot \alpha_1 \cdot l_4}{2 \cdot l_0} = + 312.4 \text{ N}$$

$$P_{ra_4} = P_4 + \frac{m_1 \cdot \alpha_1 \cdot l_5}{2 \cdot l_0} + \frac{m_2 \cdot \alpha_1 \cdot l_4}{2 \cdot l_0} = +5077.6 \text{ N}$$

■ **Applied load in the lateral direction P<sub>tra</sub><sub>n</sub>**

$$P_{tra_1} = + \frac{m_1 \cdot \alpha_1 \cdot l_3}{2 \cdot l_0} = + 333.3 \text{ N}$$

$$P_{tra_2} = - \frac{m_1 \cdot \alpha_1 \cdot l_3}{2 \cdot l_0} = - 333.3 \text{ N}$$

$$P_{tra_3} = - \frac{m_1 \cdot \alpha_1 \cdot l_3}{2 \cdot l_0} = - 333.3 \text{ N}$$

$$P_{tra_4} = + \frac{m_1 \cdot \alpha_1 \cdot l_3}{2 \cdot l_0} = + 333.3 \text{ N}$$

● **During rightward deceleration**

■ **Applied load in the radial direction P<sub>rd</sub><sub>n</sub>**

$$P_{rd_1} = P_1 - \frac{m_1 \cdot \alpha_3 \cdot l_5}{2 \cdot l_0} - \frac{m_2 \cdot \alpha_3 \cdot l_4}{2 \cdot l_0} = +1835.4 \text{ N}$$

$$P_{rd_2} = P_2 + \frac{m_1 \cdot \alpha_3 \cdot l_5}{2 \cdot l_0} + \frac{m_2 \cdot \alpha_3 \cdot l_4}{2 \cdot l_0} = +5514.6 \text{ N}$$

$$P_{rd_3} = P_3 + \frac{m_1 \cdot \alpha_3 \cdot l_5}{2 \cdot l_0} + \frac{m_2 \cdot \alpha_3 \cdot l_4}{2 \cdot l_0} = +4534.6 \text{ N}$$

$$P_{rd_4} = P_4 - \frac{m_1 \cdot \alpha_3 \cdot l_5}{2 \cdot l_0} - \frac{m_2 \cdot \alpha_3 \cdot l_4}{2 \cdot l_0} = + 855.4 \text{ N}$$

### ■ Applied load in the lateral direction $P_{trd}$

$$P_{trd1} = - \frac{m_1 \cdot \alpha_3 \cdot l_3}{2 \cdot l_0} = -111.1 \text{ N}$$

$$P_{trd2} = + \frac{m_1 \cdot \alpha_3 \cdot l_3}{2 \cdot l_0} = +111.1 \text{ N}$$

$$P_{trd3} = + \frac{m_1 \cdot \alpha_3 \cdot l_3}{2 \cdot l_0} = +111.1 \text{ N}$$

$$P_{trd4} = + \frac{m_1 \cdot \alpha_3 \cdot l_3}{2 \cdot l_0} = -111.1 \text{ N}$$

### [Combined Radial And Thrust Load]

#### ● During uniform motion:

$$P_{E1} = P_1 = 2891 \text{ N}$$

$$P_{E2} = P_2 = 4459 \text{ N}$$

$$P_{E3} = P_3 = 3479 \text{ N}$$

$$P_{E4} = P_4 = 1911 \text{ N}$$

#### ● During leftward acceleration

$$P_{El a1} = |P_{l a1}| + |P_{tl a1}| = 608.9 \text{ N}$$

$$P_{El a2} = |P_{l a2}| + |P_{tl a2}| = 7958.9 \text{ N}$$

$$P_{El a3} = |P_{l a3}| + |P_{tl a3}| = 6978.9 \text{ N}$$

$$P_{El a4} = |P_{l a4}| + |P_{tl a4}| = 1588.9 \text{ N}$$

#### ● During leftward deceleration

$$P_{El d1} = |P_{l d1}| + |P_{tl d1}| = 4057.7 \text{ N}$$

$$P_{El d2} = |P_{l d2}| + |P_{tl d2}| = 3514.5 \text{ N}$$

$$P_{El d3} = |P_{l d3}| + |P_{tl d3}| = 2534.5 \text{ N}$$

$$P_{El d4} = |P_{l d4}| + |P_{tl d4}| = 3077.7 \text{ N}$$

### [Static Safety Factor]

As indicated above, the maximum load is applied to the LM Guide during the leftward acceleration of the second LM block. Therefore, the static safety factor ( $f_s$ ) is obtained in the following equation.

$$f_s = \frac{C_0}{P_{El a2}} = \frac{81.4 \times 10^3}{7958.9} = 10.2$$

#### ● During rightward acceleration

$$P_{Er a1} = |P_{ra1}| + |P_{tra1}| = 6390.9 \text{ N}$$

$$P_{Er a2} = |P_{ra2}| + |P_{tra2}| = 1625.7 \text{ N}$$

$$P_{Er a3} = |P_{ra3}| + |P_{tra3}| = 645.7 \text{ N}$$

$$P_{Er a4} = |P_{ra4}| + |P_{tra4}| = 5410.9 \text{ N}$$

#### ● During rightward deceleration

$$P_{Er d1} = |P_{rd1}| + |P_{trd1}| = 1946.5 \text{ N}$$

$$P_{Er d2} = |P_{rd2}| + |P_{trd2}| = 5625.7 \text{ N}$$

$$P_{Er d3} = |P_{rd3}| + |P_{trd3}| = 4645.7 \text{ N}$$

$$P_{Er d4} = |P_{rd4}| + |P_{trd4}| = 966.5 \text{ N}$$

### [Average Load $P_{m1}$ ]

Obtain the average load applied to each LM block.

$$P_{m1} = \sqrt[3]{\frac{1}{2 \cdot l_s} (P_{E1} a_1^3 \cdot S_1 + P_{E2} \cdot S_2 + P_{E1} d_1^3 \cdot S_3 + P_{E1} a_1^3 \cdot S_1 + P_{E1} \cdot S_2 + P_{E1} d_1^3 \cdot S_3)}$$

$$= \sqrt[3]{\frac{1}{2 \times 1450} (608.9^3 \times 12.5 + 2891^3 \times 1400 + 4057.7^3 \times 37.5 + 6390.9^3 \times 12.5 + 2891^3 \times 1400 + 1946.5^3 \times 37.5)}$$

$$= 2940.1 \text{ N}$$

$$P_{m2} = \sqrt[3]{\frac{1}{2 \cdot l_s} (P_{E2} a_2^3 \cdot S_1 + P_{E2} \cdot S_2 + P_{E2} d_2^3 \cdot S_3 + P_{E2} a_2^3 \cdot S_1 + P_{E2} \cdot S_2 + P_{E2} d_2^3 \cdot S_3)}$$

$$= \sqrt[3]{\frac{1}{2 \times 1450} (7958.9^3 \times 12.5 + 4459^3 \times 1400 + 3514.5^3 \times 37.5 + 1625.7^3 \times 12.5 + 4459^3 \times 1400 + 5625.7^3 \times 37.5)}$$

$$= 4492.2 \text{ N}$$

$$P_{m3} = \sqrt[3]{\frac{1}{2 \cdot l_s} (P_{E3} a_3^3 \cdot S_1 + P_{E3} \cdot S_2 + P_{E3} d_3^3 \cdot S_3 + P_{E3} a_3^3 \cdot S_1 + P_{E3} \cdot S_2 + P_{E3} d_3^3 \cdot S_3)}$$

$$= \sqrt[3]{\frac{1}{2 \times 1450} (6978.9^3 \times 12.5 + 3479^3 \times 1400 + 2534.5^3 \times 37.5 + 645.7^3 \times 12.5 + 3479^3 \times 1400 + 4645.7^3 \times 37.5)}$$

$$= 3520.4 \text{ N}$$

$$P_{m4} = \sqrt[3]{\frac{1}{2 \cdot l_s} (P_{E4} a_4^3 \cdot S_1 + P_{E4} \cdot S_2 + P_{E4} d_4^3 \cdot S_3 + P_{E4} a_4^3 \cdot S_1 + P_{E4} \cdot S_2 + P_{E4} d_4^3 \cdot S_3)}$$

$$= \sqrt[3]{\frac{1}{2 \times 1450} (1588.9^3 \times 12.5 + 1911^3 \times 1400 + 3077.7^3 \times 37.5 + 5410.9^3 \times 12.5 + 1911^3 \times 1400 + 966.5^3 \times 37.5)}$$

$$= 1985.5 \text{ N}$$

### [Nominal Life $L_n$ ]

The nominal life of the four LM blocks is obtained from the corresponding nominal life equations shown below.

$$L_1 = \left( \frac{C}{f_w \cdot P_{m1}} \right)^3 \times 50 = 73700 \text{ km}$$

$$L_2 = \left( \frac{C}{f_w \cdot P_{m2}} \right)^3 \times 50 = 20600 \text{ km}$$

$$L_3 = \left( \frac{C}{f_w \cdot P_{m3}} \right)^3 \times 50 = 43000 \text{ km}$$

$$L_4 = \left( \frac{C}{f_w \cdot P_{m4}} \right)^3 \times 50 = 239000 \text{ km}$$

(where  $f_w = 1.5$ )

Therefore, the service life of the LM Guide used in a machine or equipment under the conditions stated above is equivalent to the nominal life of the second LM block, which is 20,600 km.

## Example of Calculating the Nominal Life (2) - with Vertical Mount

[Conditions]

Model No.	: HSR25CA2SS+1500L-II	
	(basic dynamic load rating: C =19.9 kN)	
	(basic static load rating: C <sub>0</sub> =34.4 kN)	
Mass	: m <sub>0</sub> =100 kg	Distance : l <sub>0</sub> =300 mm
	m <sub>1</sub> =200 kg	l <sub>1</sub> =80 mm
	m <sub>2</sub> =100 kg	l <sub>2</sub> =50 mm
Stroke	: l <sub>s</sub> =1000 mm	l <sub>3</sub> =280 mm
		l <sub>4</sub> =150 mm
		l <sub>5</sub> =250 mm

The mass (m<sub>0</sub>) is loaded only during ascent; it is removed during descent.

Gravitational acceleration g=9.8 (m/s<sup>2</sup>)

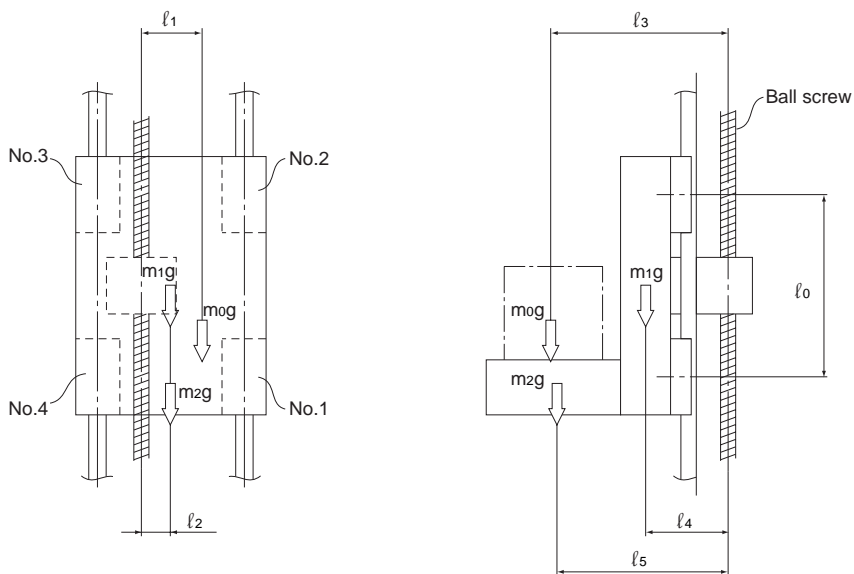

Fig.14 Condition

**[Load Applied to the LM Block]**

● **During Ascent**

■ **Load applied to each LM block in the radial direction  $Pu_r$  during ascent**

$$Pu_1 = + \frac{m_1 g \cdot l_4}{2 \cdot l_0} + \frac{m_2 g \cdot l_5}{2 \cdot l_0} + \frac{m_0 g \cdot l_3}{2 \cdot l_0} = + 1355.6 \text{ N}$$

$$Pu_2 = - \frac{m_1 g \cdot l_4}{2 \cdot l_0} - \frac{m_2 g \cdot l_5}{2 \cdot l_0} - \frac{m_0 g \cdot l_3}{2 \cdot l_0} = - 1355.6 \text{ N}$$

$$Pu_3 = - \frac{m_1 g \cdot l_4}{2 \cdot l_0} - \frac{m_2 g \cdot l_5}{2 \cdot l_0} - \frac{m_0 g \cdot l_3}{2 \cdot l_0} = - 1355.6 \text{ N}$$

$$Pu_4 = + \frac{m_1 g \cdot l_4}{2 \cdot l_0} + \frac{m_2 g \cdot l_5}{2 \cdot l_0} + \frac{m_0 g \cdot l_3}{2 \cdot l_0} = + 1355.6 \text{ N}$$

■ **Load applied to each LM block in the lateral direction  $Ptu_r$  during ascent**

$$Ptu_1 = + \frac{m_1 g \cdot l_2}{2 \cdot l_0} + \frac{m_2 g \cdot l_2}{2 \cdot l_0} + \frac{m_0 g \cdot l_1}{2 \cdot l_0} = + 375.7 \text{ N}$$

$$Ptu_2 = - \frac{m_1 g \cdot l_2}{2 \cdot l_0} - \frac{m_2 g \cdot l_2}{2 \cdot l_0} - \frac{m_0 g \cdot l_1}{2 \cdot l_0} = - 375.7 \text{ N}$$

$$Ptu_3 = - \frac{m_1 g \cdot l_2}{2 \cdot l_0} - \frac{m_2 g \cdot l_2}{2 \cdot l_0} - \frac{m_0 g \cdot l_1}{2 \cdot l_0} = - 375.7 \text{ N}$$

$$Ptu_4 = + \frac{m_1 g \cdot l_2}{2 \cdot l_0} + \frac{m_2 g \cdot l_2}{2 \cdot l_0} + \frac{m_0 g \cdot l_1}{2 \cdot l_0} = + 375.7 \text{ N}$$

● **During Descent**

■ **Load applied to each LM block in the radial direction  $Pd_r$  during descent**

$$Pd_1 = + \frac{m_1 g \cdot l_4}{2 \cdot l_0} + \frac{m_2 g \cdot l_5}{2 \cdot l_0} = + 898.3 \text{ N}$$

$$Pd_2 = - \frac{m_1 g \cdot l_4}{2 \cdot l_0} - \frac{m_2 g \cdot l_5}{2 \cdot l_0} = - 898.3 \text{ N}$$

$$Pd_3 = - \frac{m_1 g \cdot l_4}{2 \cdot l_0} - \frac{m_2 g \cdot l_5}{2 \cdot l_0} = - 898.3 \text{ N}$$

$$Pd_4 = + \frac{m_1 g \cdot l_4}{2 \cdot l_0} + \frac{m_2 g \cdot l_5}{2 \cdot l_0} = + 898.3 \text{ N}$$

■ **Load applied to each LM block in the lateral direction  $Ptd_r$  during descent**

$$Ptd_1 = + \frac{m_1 g \cdot l_2}{2 \cdot l_0} + \frac{m_2 g \cdot l_2}{2 \cdot l_0} = + 245 \text{ N}$$

$$Ptd_2 = - \frac{m_1 g \cdot l_2}{2 \cdot l_0} - \frac{m_2 g \cdot l_2}{2 \cdot l_0} = - 245 \text{ N}$$

$$Ptd_3 = - \frac{m_1 g \cdot l_2}{2 \cdot l_0} - \frac{m_2 g \cdot l_2}{2 \cdot l_0} = - 245 \text{ N}$$

$$Ptd_4 = + \frac{m_1 g \cdot l_2}{2 \cdot l_0} + \frac{m_2 g \cdot l_2}{2 \cdot l_0} = + 245 \text{ N}$$

**[Combined Radial And Thrust Load]****● During Ascent**

$$P_{EU1} = |P_{U1}| + |Pt_{U1}| = 1731.3 \text{ N}$$

$$P_{EU2} = |P_{U2}| + |Pt_{U2}| = 1731.3 \text{ N}$$

$$P_{EU3} = |P_{U3}| + |Pt_{U3}| = 1731.3 \text{ N}$$

$$P_{EU4} = |P_{U4}| + |Pt_{U4}| = 1731.3 \text{ N}$$

**● During Descent**

$$P_{Ed1} = |Pd_1| + |Ptd_1| = 1143.3 \text{ N}$$

$$P_{Ed2} = |Pd_2| + |Ptd_2| = 1143.3 \text{ N}$$

$$P_{Ed3} = |Pd_3| + |Ptd_3| = 1143.3 \text{ N}$$

$$P_{Ed4} = |Pd_4| + |Ptd_4| = 1143.3 \text{ N}$$

**[Static Safety Factor]**

The static safety factor ( $f_s$ ) of the LM Guide used in a machine or equipment under the conditions stated above is obtained as follows.

$$f_s = \frac{C_0}{P_{EU2}} = \frac{34.4 \times 10^3}{1731.3} = 19.9$$

**[Average Load  $P_{m1}$ ]**

Obtain the average load applied to each LM block.

$$P_{m1} = \sqrt[3]{\frac{1}{2 \cdot l_s} (P_{EU1}^3 \cdot l_s + P_{Ed1}^3 \cdot l_s)} = 1495.1 \text{ N}$$

$$P_{m2} = \sqrt[3]{\frac{1}{2 \cdot l_s} (P_{EU2}^3 \cdot l_s + P_{Ed2}^3 \cdot l_s)} = 1495.1 \text{ N}$$

$$P_{m3} = \sqrt[3]{\frac{1}{2 \cdot l_s} (P_{EU3}^3 \cdot l_s + P_{Ed3}^3 \cdot l_s)} = 1495.1 \text{ N}$$

$$P_{m4} = \sqrt[3]{\frac{1}{2 \cdot l_s} (P_{EU4}^3 \cdot l_s + P_{Ed4}^3 \cdot l_s)} = 1495.1 \text{ N}$$

**[Nominal Life  $L_n$ ]**

The nominal life of the four LM blocks is obtained from the corresponding nominal life equations shown below.

$$L_1 = \left( \frac{C}{f_w \cdot P_{m1}} \right)^3 \times 50 = 68200 \text{ km}$$

$$L_2 = \left( \frac{C}{f_w \cdot P_{m2}} \right)^3 \times 50 = 68200 \text{ km}$$

$$L_3 = \left( \frac{C}{f_w \cdot P_{m3}} \right)^3 \times 50 = 68200 \text{ km}$$

$$L_4 = \left( \frac{C}{f_w \cdot P_{m4}} \right)^3 \times 50 = 68200 \text{ km}$$

(where  $f_w = 1.2$ )

Therefore, the service life of the LM Guide used in a machine or equipment under the conditions stated above is 68,200 km.

# Predicting the Rigidity

## Selecting a Radial Clearance (Preload)

Since the radial clearance of an LM Guide greatly affects the running accuracy, load carrying capacity and rigidity of the LM Guide, it is important to select an appropriate clearance according to the application. In general, selecting a negative clearance (i.e., a preload\* is applied) while taking into account possible vibrations and impact generated from reciprocating motion favorably affects the service life and the accuracy.

For specific radial clearances, contact THK. We will help you select the optimal clearance according to the conditions.

The clearances of all LM Guide models (except model HR, GSR and GSR-R, which are separate types) are adjusted as specified before shipment, and therefore they do not need further preload adjustment.

Preload is an internal load applied to the rolling elements (balls, rollers, etc.) of an LM block in advance in order to increase its rigidity.

Table13 Types of Radial Clearance

	Normal Clearance	Clearance C1 (Light Preload)	Clearance C0 (Medium Preload)
Condition	<ul style="list-style-type: none"> <li>The loading direction is fixed, impact and vibrations are minimal and 2 rails are installed in parallel.</li> <li>Very high precision is not required, and the sliding resistance must be as low as possible.</li> </ul>	<ul style="list-style-type: none"> <li>An overhang load or moment load is applied.</li> <li>LM Guide is used in a single-rail configuration.</li> <li>Light load and high accuracy are required.</li> </ul>	<ul style="list-style-type: none"> <li>High rigidity is required and vibrations and impact are applied.</li> <li>Heavy-cutting machine tool</li> </ul>
Examples of applications	<ul style="list-style-type: none"> <li>Beam-welding machine</li> <li>Book-binding machine</li> <li>Automatic packaging machine</li> <li>XY axes of general industrial machinery</li> <li>Automatic sash-manufacturing machine</li> <li>Welding machine</li> <li>Flame cutting machine</li> <li>Tool changer</li> <li>Various kinds of material feeder</li> </ul>	<ul style="list-style-type: none"> <li>Grinding machine table feed axis</li> <li>Automatic coating machine</li> <li>Industrial robot</li> <li>various kinds of material high speed feeder</li> <li>NC drilling machine</li> <li>Vertical axis of general industrial machinery</li> <li>Printed circuit board drilling machine</li> <li>Electric discharge machine</li> <li>Measuring instrument</li> <li>Precision XY table</li> </ul>	<ul style="list-style-type: none"> <li>Machining center</li> <li>NC lathe</li> <li>Grinding stone feed axis of grinding machine</li> <li>Milling machine</li> <li>Vertical/horizontal boring machine</li> <li>Tool rest guide</li> <li>Vertical axis of machine tool</li> </ul>

## Service Life with a Preload Considered

When using an LM Guide under a medium preload (clearance C0), it is necessary to calculate the service life while taking into account the magnitude of the preload.

To identify the appropriate preload for any selected LM Guide model, contact THK.

## Rigidity

When the LM Guide receives a load, its rolling element, LM blocks and LM rails are elastically deformed within a permissible load range. The ratio between the displacement and the load is called rigidity value. (Rigidity values are obtained using the equation shown below.) The LM Guide's rigidity increases according to the magnitude of the preload. Fig.15 shows rigidity difference between normal, C1 and C0 clearances.

The effect of a preload for a 4-way equal load type is translated into the calculated load approx. 2.8 times greater than the magnitude of the preload.

Fig.15 Rigidity Data

$$K = \frac{P}{\delta}$$

K	: Rigidity value	(N/μm)
δ	: Deflection	(μm)
P	: Calculated load	(N)

## Radial Clearance Standard for Each Model

### [Radial clearances of models SHS and SCR]

Unit:  $\mu\text{m}$

Indication symbol	Normal	Light preload	Medium preload
Model No.	No Symbol	C1	C0
15	-5 to 0	-12 to -5	—
20	-6 to 0	-12 to -6	-18 to -12
25	-8 to 0	-14 to -8	-20 to -14

# Determining the Accuracy

## Accuracy Standards

Accuracy of the LM Guide is specified in terms of running parallelism, dimensional tolerance for height and width, and height and width difference between a pair when 2 or more LM blocks are used on one rail or when 2 or more rails are mounted on the same plane.

For details, see "Accuracy Standard for Each Model" on A-118 to A-128.

### [Running of Parallelism]

It refers to the tolerance for parallelism between the LM block and the LM rail reference surface when the LM block travels the whole length of the LM rail with the LM rail secured on the reference reference surface using bolts.

Fig.16 Running of Parallelism

### [Difference in Height M]

Indicates a difference between the minimum and maximum values of height ( $M$ ) of each of the LM blocks used on the same plane in combination.

### [Difference in Width $W_2$ ]

Indicates a difference between the minimum and maximum values of the width ( $W_2$ ) between each of the LM blocks, mounted on one LM rail in combination, and the LM rail.

Note1) When 2 or more rails are used on the same plane in parallel, only the width ( $W_2$ ) tolerance and the difference on the master rail apply. The master LM rail is imprinted with "KB" (except for normal grade products) following the serial number.

Fig.17 Master LM Rail

Note2) Accuracy measurements each represent the average value of the central point or the central area of the LM block.

Note3) The LM rail is smoothly curved so that the required accuracy is easily achieved by pressing the rail to the reference surface of the machine.

If it is mounted on a less rigid base such as an aluminum base, the curve of the rail will affect the accuracy of the machine. Therefore, it is necessary to define straightness of the rail in advance.

## Guidelines for Accuracy Grades by Machine Type

Table14 shows guidelines for selecting an accuracy grade of the LM Guide according to the machine type.

Table14 Guideline for Accuracy Grades by Machine Type

**Point of Selection**  
Determining the Accuracy

- Accuracies of model HR are categorized into normal, high accuracy, precision, super precision and ultra precision grades as indicated in Table25.

Fig.23

Table25 Accuracy Standard for Model HR

Unit: mm

Accuracy standards	Normal grade	High-accuracy grade	Precision grade	Super precision grade	Ultra precision grade
Item	No Symbol	H	P	SP	UP
Dimensional tolerance in height M	±0.1	±0.05	±0.025	±0.015	±0.01
Difference in height M <sup>Note 1)</sup>	0.03	0.02	0.01	0.005	0.003
Dimensional tolerance for total width W <sub>0</sub>	±0.1		±0.05		
Difference in total width W <sub>0</sub> <sup>Note 2)</sup>	0.03	0.015	0.01	0.005	0.003
Parallelism of the raceway against surfaces A and B	ΔC (as shown in Table26)				

Note1) Difference in height M applies to a set of LM Guides used on the same plane.

Note2) Difference in total width W<sub>0</sub> applies to LM blocks used in combination on one LM rail.

Note3) Dimensional tolerance and difference in total width W<sub>0</sub> for precision and higher grades apply only to the master-rail side among a set of LM Guides. The master rail is imprinted with "KB" following a serial number.

Table26 LM Rail Length and Running Parallelism by Accuracy Standard

Unit: μm

LM rail length (mm)		Running Parallelism Values				
Above	Or less	Normal grade	High-accuracy grade	Precision grade	Super precision grade	Ultra precision grade
—	50	5	3	2	1.5	1

LM Guide

# Feature of Each Model

## Structure and Features of the Caged Ball LM Guide

Fig.1 Structural Drawing of the Caged Ball LM Guide Model SHS

Fig.2 Circulation Structure inside the LM Block of the Caged Ball LM Guide

With the Caged Ball LM Guide, the use of a ball cage allows lines of evenly spaced balls to circulate, thus to eliminate friction between the balls.

In addition, grease held in a space between the ball circulation path and the ball cage (grease pocket) is applied on the contact surface between each ball and the ball cage as the ball rotates, forming an oil film on the ball surface. As a result, an oil film is not easily broken.

## Advantages of the Ball Cage Technology

- (1) The absence of friction between balls, together with increased grease retention, achieves long service life and long-term maintenance-free (lubrication-free) operation.
- (2) The absence of ball-to-ball collision achieves low noise and acceptable running sound.
- (3) The absence of friction between balls achieves low heat generation and high speed operation.
- (4) The circulation of lines of evenly spaced balls ensures smooth ball rotation.
- (5) The absence of friction between balls allows high grease retention and low dust generation.

### [Long Service Life and Long-term Maintenance-free Operation]

#### ● Nominal Life Equation for the LM Guide

$$L = \left( \frac{C}{P} \right)^3 \times 50$$

L : Nominal life (km)

C : Basic dynamic load rating (N)

P : Applied load (N)

As indicated in the equation, the greater the basic dynamic load rating, the longer the nominal life of the LM Guide.

### [Example of Calculation]

#### Comparison of Nominal Life Between the Caged Ball LM Guide model SHS25LR and the Conventional Full-ball Type Model HSR25LR

##### Calculation Assuming P = 13.6 kN

Basic dynamic rated load (C) of SHS25LR = 36.8 kN

Basic dynamic rated load (C) of HSR25LR = 27.2 kN

$$\text{Model SHS25LR} \quad L = \left( \frac{C}{P} \right)^3 \times 50 = \left( \frac{36.8}{13.6} \right)^3 \times 50 = 990 \text{ km}$$

$$\text{Model HSR25LR} \quad L = \left( \frac{C}{P} \right)^3 \times 50 = \left( \frac{27.2}{13.6} \right)^3 \times 50 = 400 \text{ km}$$

The nominal life of the Caged Ball LM Guide model SHS25LR is 2.4 times\* longer than the conventional full-ball type model HSR25LR.

\* When selecting a model number, it is necessary to perform a service life calculation according to the conditions.

### ● Data on Long Service Life and Long-term Maintenance-free Operation

Use of a ball cage eliminates friction between balls and increases grease retention, thus to achieve long service life and long-term maintenance-free operation.

[Condition]

Model No. : SHS25/HSR25

Speed : 60m/min

Stroke : 350mm

Acceleration: 9.8m/s<sup>2</sup>

Orientation : horizontal

Load : Caged Ball LM Guide model SHS: 11.1kN

Conventional full-ball type model HSR: 9.8kN

Features of Each Model

Structure and Features of the Caged Ball LM Guide

[Low Noise, Acceptable Running Sound]

● Noise Level Data

Since the ball circulation path inside the LM block is made of resin, metallic noise between balls and the LM block is eliminated. In addition, use of a ball cage eliminates metallic noise of ball-to-ball collision, allowing a low noise level to be maintained even at high speed.

Model SHS35LV: Caged Ball LM Guide

Model HSR35LR: conventional full-ball type

Comparison of Noise Levels between Model SHS35LV and Model HSR35LR

Comparison of Noise Levels between Model SHS35LV and Model HSR35LR (at speed of 50 m/min)

[High Speed]

● High-speed Durability Test Data

Since use of a ball cage eliminates friction between balls, only a low level of heat is generated and superbly high speed is achieved.

[Condition]

Model No. : Caged Ball LM Guide Model SHS65LVSS

Speed : 200m/min

Stroke : 2500mm

Lubrication : initial lubrication only

Applied load: 34.5kN

Acceleration: 1.5G

Grease remains, and no anomaly is observed in the balls and grease.

Detail view of the ball cage

[Smooth Motion]

● **Rolling Resistance Data**

Use of a ball cage allows the balls to be uniformly aligned and prevents a line of balls from meandering as they enter the LM block. This enables smooth and stable motion to be achieved, minimizes fluctuations in rolling resistance, and ensures high accuracy, in any mounting orientation.

Model SHS25LV: Caged Ball LM Guide  
 Model HSR25LR: conventional full-ball type

Rolling Resistance Fluctuation Data with HSR25LR  
 (Feeding speed: 10mm/sec)

Rolling Resistance Fluctuation Data with SHS25LV  
 (Feeding speed: 10mm/sec)

[Low dust generation]

● **Low Dust Generation Data**

In addition to friction between balls, metallic contact has also been eliminated by using resin for the through holes. Furthermore, the Caged Ball LM Guide has a high level of grease retention and minimizes fly loss of grease, thus to achieve superbly low dust generation.

## Structure and Features

Balls roll in four rows of raceways precision-ground on an LM rail and an LM block, and ball cages and endplates incorporated in the LM block allow the balls to circulate.

Each row of balls is placed at a contact angle of  $45^\circ$  so that the rated loads applied to the LM block are uniform in the four directions (radial, reverse radial and lateral directions), enabling the LM Guide to be used in all orientations. In addition, the LM block can receive a well-balanced preload, increasing the rigidity in the four directions while maintaining a constant, low friction coefficient. With the low sectional height and the high rigidity design of the LM block, this model achieves highly accurate and stable straight motion.

### [4-way Equal Load]

Each row of balls is placed at a contact angle of  $45^\circ$  so that the rated loads applied to the LM block are uniform in the four directions (radial, reverse radial and lateral directions), enabling the LM Guide to be used in all orientations and in extensive applications.

### [Self-adjustment Capability]

The self-adjustment capability through front-to-front configuration of THK's unique circular-arc grooves (DF set) enables a mounting error to be absorbed even under a preload, thus to achieve highly accurate, smooth straight motion.

### [Global Standard Size]

SHS is designed to have dimensions almost the same as that of Full Ball LM Guide model HSR, which THK as a pioneer of the linear motion system has developed and is practically a global standard size.

### [Low Center of Gravity, High Rigidity]

As a result of downsizing the LM rail section, the center of gravity is lowered and the rigidity is increased.

## Types and Features

### Model SHS-C

Specification Table⇒B-6

The flange of the LM block has tapped holes.  
Can be mounted from the top or the bottom.  
Used in places where the table cannot have through holes for mounting bolts.

### Model SHS-V

Specification Table⇒B-8

With this type, the LM block has a smaller width (W) and tapped holes.  
Used in places where the space for table width is limited.

### Model SHS-R

Specification Table⇒B-10

The LM block has a smaller width (W) and the mounting holes are tapped.  
It succeeds the height dimension of full-ball type LM Guide HSR-R.

## Features of Each Model

### Global Standard Size Model SHS

## Model SHS-LC

The LM block has the same cross-sectional shape as model SHS-C, but has a longer overall LM block length (L) and a greater rated load.

Specification Table⇒B-6

LM Guide

## Model SHS-LV

The LM block has the same cross-sectional shape as model SHS-V, but has a longer overall LM block length (L) and a greater rated load.

Specification Table⇒B-8

## Model SHS-LR

The LM block has the same cross-sectional shape as model SHS-R, but has a longer overall LM block length (L) and a greater rated load.

Specification Table⇒B-10

## Rated Loads in All Directions

Model SHS is capable of receiving loads in four directions: radial, reverse radial and lateral directions.

The basic load ratings are uniform in the four directions (radial, reverse radial and lateral directions), and their actual values are provided in the specification table for SHS.

Fig.1

## Equivalent Load

When the LM block of model SHS receives loads in all directions simultaneously, the equivalent load is obtained from the equation below.

$$P_E = P_R (P_L) + P_T$$

$P_E$	: Equivalent load	(N)
	: Radial direction	
	: Reverse radial direction	
	: Lateral direction	
$P_R$	: Radial load	(N)
$P_L$	: Reverse radial load	(N)
$P_T$	: Lateral load	(N)

## Structure and Features

---

Balls roll in four rows of raceways precision-ground on an LM rail and an LM block, and ball cages and endplates incorporated in the LM block allow the balls to circulate.

Use of the ball cage eliminates friction between balls and increases grease retention, thus to achieve low noise, high speed and long-term maintenance-free operation.

### [Compact, Radial Type]

The compact design with a low sectional height and the ball contact structure at 90° make SSR an optimal model for horizontal guides.

### [Superb Planar Running Accuracy]

Use of a ball contact structure at 90° in the radial direction reduces displacement in the radial direction under a radial load and achieves highly accurate, smooth straight motion.

### [Self-adjustment Capability]

The self-adjustment capability through front-to-front configuration of THK's unique circular-arc grooves (DF set) enables a mounting error to be absorbed even under a preload, thus to achieve highly accurate, smooth straight motion.

### [Stainless Steel Type also Available as Standard]

A stainless steel type with its LM block, LM rail and balls all made of stainless steel, which is superbly corrosion resistant, is also available as standard.

## Types and Features

### Model SSR-XW

With this type, the LM block has a smaller width (W) and tapped holes.

Specification Table⇒B-16

### Model SSR-XV

This type has the same cross-sectional shape as SSR-XW but has a shorter overall LM block length (L).

Specification Table⇒B-18

### Model SSR-XTB

Since the LM block can be mounted from the bottom, this type is optimal for applications where through holes for mounting bolts cannot be drilled on the table.

Specification Table⇒B-20

## Rated Loads in All Directions

Model SSR is capable of receiving loads in four directions: radial, reverse radial and lateral directions.

Its basic dynamic load rating is represented by the symbol in the radial direction indicated in Fig.1, and the actual value is provided in the specification table for SSR. The values in the reverse radial and lateral directions are obtained from Table1 below.

Fig.1

Table1 Rated Load of Model SSR in All Directions

Direction	Basic dynamic load rating	Basic static load rating
Radial direction	C	C <sub>0</sub>
Reverse radial direction	C <sub>L</sub> =0.50C	C <sub>0L</sub> =0.50C <sub>0</sub>
Lateral directions	C <sub>T</sub> =0.53C	C <sub>0T</sub> =0.43C <sub>0</sub>

## Equivalent Load

When the LM block of model SSR receives a reverse radial direction and a lateral direction simultaneously, the equivalent load is obtained in the equation below.

$$P_E = X \cdot P_L + Y \cdot P_T$$

P<sub>E</sub> : Equivalent load (N)

: Reverse radial direction

: Lateral direction

P<sub>L</sub> : Reverse radial load (N)

P<sub>T</sub> : Lateral load (N)

X, Y : Equivalent factor (see Table2)

Table2 Equivalent Factor of Model SSR

P <sub>E</sub>	X	Y
Equivalent load in reverse radial direction	1	1.155
Equivalent load in lateral direction	0.866	1

---

## Structure and Features

---

Balls roll in four rows of raceways precision-ground on an LM rail and an LM block, and ball cages and endplates incorporated in the LM block allow the balls to circulate. Use of the ball cage eliminates friction between balls and increases grease retention, thus to achieve low noise, high speed and long-term maintenance-free operation.

### [High Rigidity]

Models SNR/SNS are the most rigid types among the Caged Ball LM Guide series.

Both the radial type SNR and the 4-way equal load type SNS are available for each size variation. Depending on the intended use, you can select either type.

### [Ultra-heavy Load]

Since the curvature of the raceway is approximated to the ball diameter, the ball contact area under a load is increased and the LM Guide is capable of receiving an ultra-heavy load.

### [Increased Damping Effect]

In rapid traverse where the LM block travels at high speed, no differential slip occurs and smooth motion is maintained, thus achieving highly accurate positioning. In heavy cutting where the LM block travels at low speed, favorable differential slip according to the cutting load occurs to increase frictional resistance, thus increasing the damping capacity.

## Types and Features

### Models SNR-R/SNS-R

Specification Table⇒B-26/B-28

With this type, the LM block has a smaller width (W) and tapped holes.

Used in places where the space for table width is limited.

### Models SNR-C/SNS-C

Specification Table⇒B-30/B-32

The flange of the LM block has tapped holes.

Can be mounted from the top or the bottom.

Used in places where the table cannot have through holes for mounting bolts.

### Models SNR-RH/SNS-RH (Build to Order)

Specification Table⇒B-34/B-36

The dimensions are almost the same as that of LM Guide models SHS and HSR, and the LM block has tapped holes.

## Features of Each Model

Ultra-heavy Load Type Models SNR/SNS

### Models SNR-CH/SNS-CH (Build to Order)

Specification Table⇒B-38/B-40

The dimensions are almost the same as that of LM Guide models SHS and HSR, and the flange of the LM block has tapped holes.

LM Guide

### Models SNR-LR/SNS-LR

Specification Table⇒B-26/B-28

The LM block has the same cross-sectional shape as models SNR-R/SNS-R, but has a longer overall LM block length (L) and a greater rated load.

### Models SNR-LC/SNS-LC

Specification Table⇒B-30/B-32

The LM block has the same cross-sectional shape as models SNR-C/SNS-C, but has a longer overall LM block length (L) and a greater rated load.

## Models SNR-LRH/SNS-LRH (Build to Order) [Specification Table⇒B-34/B-36](#)

The LM block has the same cross-sectional shape as models SNR-RH/SNS-RH, but has a longer overall LM block length (L) and a greater rated load.

## Models SNR-LCH/SNS-LCH (Build to Order) [Specification Table⇒B-38/B-40](#)

The LM block has the same cross-sectional shape as models SNR-CH/SNS-CH, but has a longer overall LM block length (L) and a greater rated load.

## Rated Loads in All Directions

Model SNR/SNS is capable of receiving loads in four directions: radial, reverse radial and lateral directions. Their basic dynamic load ratings are represented by the symbols in the radial direction indicated in Fig.1, and the actual values are provided in the specification tables for SNR/SNS. The values in the reverse radial and lateral directions are obtained from Table1 and Table2 below.

Table1 Basic Load Ratings of Model SNR in All Directions

Direction	SNR	
	Basic dynamic load rating	Basic static load rating
Radial direction	C	C <sub>0</sub>
Reverse radial direction	C <sub>l</sub> =0.64C	C <sub>ol</sub> =0.64C <sub>0</sub>
Lateral directions	C <sub>T</sub> =0.47C	C <sub>0T</sub> =0.38C <sub>0</sub>

Table2 Basic Load Ratings of Model SNS in All Directions

Direction	SNS	
	Basic dynamic load rating	Basic static load rating
Radial direction	C	C <sub>0</sub>
Reverse radial direction	C <sub>l</sub> =0.84C	C <sub>ol</sub> =0.84C <sub>0</sub>
Lateral directions	C <sub>T</sub> =0.84C	C <sub>0T</sub> =0.84C <sub>0</sub>

## Equivalent Load

When the LM block of model SNR receives a reverse radial load and a lateral load simultaneously, the equivalent load is obtained from the equation below.

$$P_E = X \cdot P_L + Y \cdot P_T$$

- P<sub>E</sub> : Equivalent load (N)
- : Reverse radial direction
- : Lateral direction
- P<sub>L</sub> : Reverse radial load (N)
- P<sub>T</sub> : Lateral load (N)
- X, Y : Equivalent factor (see Table3)

Table3 Equivalent Factor of Model SNR

P <sub>E</sub>	X	Y
Equivalent load in reverse radial direction	1	1.678
Equivalent load in lateral direction	0.596	1

When the LM block of model SNS receives a radial load and a lateral load, or a reverse radial load and a lateral load, simultaneously, the equivalent load is obtained from the equation below.

$$P_E = X \cdot P_R (P_L) + Y \cdot P_T$$

- P<sub>E</sub> : Equivalent load (N)
- : Radial direction
- : Reverse radial direction
- : Lateral direction
- P<sub>R</sub> : Radial load (N)
- P<sub>L</sub> : Reverse radial load (N)
- P<sub>T</sub> : Lateral load (N)
- X, Y : Equivalent factor (see Table4 and Table5)

Table4 Equivalent Factor of Model SNS (When radial and lateral loads are applied)

P <sub>E</sub>	X	Y
Equivalent load in the radial direction	1	0.935
Equivalent load in lateral direction	1.07	1

Table5 Equivalent Factor of Model SNS (When reverse radial load and lateral load are applied)

P <sub>E</sub>	X	Y
Equivalent load in reverse radial direction	1	1.02
Equivalent load in lateral direction	0.986	1

## Structure and Features

---

A wide and highly rigid LM Guide that uses ball cages to achieve low noise, long-term maintenance-free operation and high speed.

### [Wide, Low Center of Gravity]

Model SHW, which has a wide LM rail and a low center of gravity, is optimal for locations requiring space saving and large  $M_c$  moment rigidity.

### [4-way Equal Load]

Each row of balls is placed at a contact angle of  $45^\circ$  so that the rated loads applied to the LM block are uniform in the four directions (radial, reverse radial and lateral directions), enabling the LM Guide to be used in all orientations and in extensive applications.

### [Self-adjustment Capability]

The self-adjustment capability through front-to-front configuration of THK's unique circular-arc grooves (DF set) enables a mounting error to be absorbed even under a preload, thus to achieve highly accurate, smooth straight motion.

### [Low Dust Generation]

Use of ball cages eliminates friction between balls and retains lubricant, thus achieving low dust generation.

## Types and Features

### Model SHW-CA

Specification Table⇒B-44

The flange of the LM block has tapped holes.  
Can be mounted from the top or the bottom.

### Model SHW-CR

Specification Table⇒B-46

The LM block has tapped holes.

## Rated Loads in All Directions

Model SHW is capable of receiving loads in four directions: radial, reverse radial and lateral directions.

The basic load ratings are uniform in the four directions (radial, reverse radial and lateral directions), and their actual values are provided in the specification table for SHW.

## Structure and Features

---

Caged Ball LM Guide model SRS has a structure where two raceways are incorporated into the compact body, enabling the model to receive loads in all directions, and to be used in locations where a moment is applied with a single rail. In addition, use of ball cages eliminates friction between balls, thus achieving high speed, low noise, acceptable running sound, long service life, and long-term maintenance-free operation.

### [Low Dust Generation]

Use of ball cages eliminates friction between balls and retains lubricant, thus achieving low dust generation. In addition, the LM block and LM rail use stainless steel, which is highly resistant to corrosion.

### [4-way Equal Load Type]

Since the right and left rows of balls under a load contact the raceway at 45°, this LM Guide is capable of receiving loads in the radial, reverse radial and lateral directions at equal values and being used in any orientations. With this well-balanced structure, this model can be used in extensive applications.

### [Compact]

Since SRS has a compact structure where the rail cross section is designed to be low and that contains only two rows of balls, it can be installed in space-saving locations.

### [Lightweight]

Since part of the LM block (e.g., around the ball relief hole) is made of resin and formed through insert molding, SRS is a lightweight, low inertia type of LM Guide.

## Types and Features

### Model SRS-M

Specification Table⇒B-50

A standard type of SRS.

Note) In addition to model SRS-M, a full-ball type without ball cage is also available. If desiring this type, indicate type "SRS-G" when placing an order. However, since SRS-G does not have a ball cage, its dynamic load rating is smaller than SRS-M. See the table of basic load ratings for SRS-G on B-51 for details.

### Model SRS-WM

Specification Table⇒B-52

Has a longer overall LM block length (L), a greater width and a larger rated load and permissible moment than SRS-M.

Note) In addition to model SRS-WM, a full-ball type without ball cage is also available. If desiring this type, indicate type "SRS-G" when placing an order. However, since SRS-G does not have a ball cage, its dynamic load rating is smaller than SRS-WM. See the table of basic load ratings for SRS-G on B-53 for details.

## Rated Loads in All Directions

Model SRS is capable of receiving loads in four directions: radial, reverse radial and lateral directions.

Their basic dynamic load ratings are represented by the symbols in the radial direction indicated in Fig.1, and the actual values are provided in the specification table for SRS. The values in the reverse radial and lateral directions are obtained from Table1 below.

Fig.1

Table1 Rated Loads of Model SRS in All Directions

Direction	Basic dynamic load rating	Basic static load rating
Radial direction	C	C <sub>0</sub>
Reverse radial direction	C <sub>L</sub> =C	C <sub>0L</sub> =C <sub>0</sub>
Lateral directions (7M/7WM/9M/9WM/20M)	C <sub>T</sub> =1.19C	C <sub>0T</sub> =1.19C <sub>0</sub>
Lateral directions (12M/12WM/15M/15WM/25M)	C <sub>T</sub> =C	C <sub>0T</sub> =C <sub>0</sub>

## Equivalent Load

When the LM block of model SRS receives a reverse radial load and a lateral load simultaneously, the equivalent load is obtained from the equation below.

$$P_E = X \cdot P_R (P_L) + Y \cdot P_T$$

P<sub>E</sub> : Equivalent load (N)  
 : Radial direction  
 : Reverse radial direction  
 : Lateral direction

P<sub>R</sub> : Radial load (N)

P<sub>L</sub> : Reverse radial load (N)

P<sub>T</sub> : Lateral load (N)

X, Y : Equivalent factor (see Table2)

Table2 Equivalent Factor of Model SRS

Equivalent Load P <sub>E</sub>	Model No.	X	Y
Radial and reverse radial direction	7M/7WM/9M/9WM/20M	1	0.839
	12M/12WM/15M/15WM/25M	1	1
Lateral directions	7M/7WM/9M/9WM/20M	1.192	1
	12M/12WM/15M/15WM/25M	1	1

## Flatness of the LM Rail and the LM Block Mounting Surface

---

The values in Table3 apply when the clearance is a normal clearance. If the clearance is C1 clearance and two rails are used in combination, we recommend using 50% or less of the value in the table.

Note) Since SRS has Gothic-arch grooves, any accuracy error in the mounting surface may negatively affect the operation. Therefore, we recommend using SRS on a highly accurate mounting surface.

Table3 Flatness of the LM Rail and the LM Block Mounting Surface  
Unit: mm

Model No.	Flatness error

## Structure and Features

---

Balls roll in four rows of raceways precision-ground on an LM rail and an LM block, and ball cages and endplates incorporated in the LM block allow the balls to circulate.

This model is an integral type of Caged Ball LM Guide that squares an internal structure similar to model SHS, which has a proven track record and is highly reliable, with another and uses two LM rails in combination. Since an orthogonal LM system can be achieved with model SCR alone, a conventionally required saddle is no longer necessary, the structure for X-Y motion can be simplified and the whole system can be downsized.

### [4-way Equal Load]

Each row of balls is placed at a contact angle of 45° so that the rated loads applied to the LM block are uniform in the four directions (radial, reverse radial and lateral directions), enabling the LM Guide to be used in all orientations and in extensive applications.

### [High Rigidity]

Since balls are arranged in four rows in a well-balanced manner, this model is stiff against a moment, and smooth straight motion is ensured even a preload is applied to increase the rigidity.

Since the rigidity of the LM block is higher than that of a combination of two LM blocks of the conventional type secured together back-to-back with bolts, this model is optimal for building an X-Y table that requires a high rigidity.

### [Compact]

This model is an integral type of Caged Ball LM Guide that squares an internal structure similar to model SHS, which has a proven track record and is highly reliable, with another and uses two LM rails in combination. Since an orthogonal LM Guide can be achieved with model SCR alone, a conventionally required saddle is no longer necessary, the structure for X-Y motion can be simplified and the whole system can be downsized.

## Types and Features

### Model SCR

Specification Table⇒B-56

This model is a standard type.

#### Drawing of Using an Inner Saddle

Model SCR can easily be assembled and adjusted by using an inner saddle to link four LM blocks together. When installed on an inner saddle, model SCR achieves a highly accurate X-Y guide and high rigidity moment in the yawing direction  (as indicated by the arrow in the figure).

## Rated Loads in All Directions

Model SCR is capable of receiving loads in four directions: radial, reverse radial and lateral directions.

The basic load ratings are defined with a LM rail and a LM block, and uniform in the four directions (radial, reverse radial and lateral directions). Their actual values are provided in the specification table for SCR.

Fig.1

## Equivalent Load

When the LM block of model SCR receives loads in all directions simultaneously, the equivalent load is obtained from the equation below.

$$P_E = P_R (P_L) + P_T$$

$P_E$	: Equivalent load	(N)
	: Radial direction	
	: Reverse radial direction	
	: Lateral direction	
$P_R$	: Radial load	(N)
$P_L$	: Reverse radial load	(N)
$P_T$	: Lateral load	(N)

## Structure and Features

Balls roll in four rows of raceways precision-ground on an LM rail and an LM block, and endplates incorporated in the LM block allow the balls to circulate.

Since retainer plates hold the balls, they do not fall off even if the LM rail is pulled out (except models HSR 8, 10 and 12).

Each row of balls is placed at a contact angle of 45° so that the rated loads applied to the LM block are uniform in the four directions (radial, reverse radial and lateral directions), enabling the LM Guide to be used in all orientations. In addition, the LM block can receive a well-balanced preload, increasing the rigidity in the four directions while maintaining a constant, low friction coefficient. With the low sectional height and the high rigidity design of the LM block, this model achieves highly accurate and stable straight motion.

### [4-way Equal Load Type]

Each row of balls is placed at a contact angle of 45° so that the rated loads applied to the LM block are uniform in the four directions (radial, reverse radial and lateral directions), enabling the LM Guide to be used in all orientations and in extensive applications.

### [High Rigidity Type]

Since balls are arranged in four rows in a well-balanced manner, a large preload can be applied and the rigidity in four directions can easily be increased.

### [Self-adjustment Capability]

The self-adjustment capability through front-to-front configuration of THK's unique circular-arc grooves (DF set) enables a mounting error to be absorbed even under a preload, thus to achieve highly accurate, smooth straight motion.

### [High Durability]

Even under a preload or excessive biased load, differential slip of balls does not occur. As a result, smooth motion, high wear resistance, and long-term maintenance of accuracy are achieved.

### [Stainless Steel Type also Available]

A special type which LM block, LM rail and balls are made of stainless steel is also available.

## Types

### Model HSR-A

Specification Table⇒B-62

The flange of its LM block has tapped holes.

### Model HSR-B

Specification Table⇒B-64

The flange of the LM block has through holes. Used in places where the table cannot have through holes for mounting bolts.

### Model HSR-R Grade Ct

Specification Table⇒B-66

The flange of its LM block has tapped holes. Can be mounted from the top or the bottom.

### Model HSR-R

Specification Table⇒B-70

Having a smaller LM block width (W) and tapped holes, this model is optimal for compact design.

Low-priced LM rails and LM blocks are individually stocked. We also have Ct grade model HSR-R available with a short delivery time.

## Model HSR-YR

When using two units of LM Guide facing each other, the previous model required much time in machining the table and had difficulty achieving the desired accuracy and adjusting the clearance. Since model HSR-YR has tapped holes on the side of the LM block, a simpler structure is gained and reduced man-hour and increase in accuracy can be achieved.

Specification Table⇒B-74

LM Guide

Fig.1 Conventional Structure

## Structure and Features

---

Balls roll in four rows of raceways precision-ground on an LM rail and an LM block, and endplates incorporated in the LM block allow the balls to circulate. Since a retainer plate holds the balls, they will not fall off even if the LM block is removed from the LM rail. With the low sectional height and the high rigidity design of the LM block, this model achieves highly accurate and stable straight motion.

### [Compact, Heavy Load]

Since it is a compact designed model that has a low sectional height and a ball contact structure rigid in the radial direction, this model is optimal for horizontal guide units.

### [Mounting accuracy can easily be achieved]

Since this model is a self-adjusting type capable of easily absorbing an accuracy error in parallelism and level between two rails, highly accurate and smooth motion can be achieved.

### [Low Noise]

The endplate installed at each end of the LM block is designed to ensure the smooth and low-noise circulation of the balls at the turning areas.

### [High Durability]

Even under a preload or excessive biased load, differential slip of balls is minimal. As a result, high wear resistance and long-term maintenance of accuracy are achieved.

### [Stainless Steel Type also Available]

A special type which LM block, LM rail and balls are made of stainless steel is also available.

---

## Types and Features

---

### Model SR-W

Specification Table⇒B-86

With this type, the LM block has a smaller width (W) and tapped holes.

---

### Model SR-TB

Specification Table⇒B-88

The LM block has the same height as model SR-W and can be mounted from the bottom.

---

### Model SR-V

**Features of Each Model**

Radial Type Model SR

**Model SR-SB**

A space-saving type whose LM block has the same cross-sectional shape as model SR-TB, but has a smaller overall LM block length (L).

Specification Table⇒B-88

LM Guide

## Characteristics of Model SR

When compared to models having a contact angle of 45°, model SR shows excellent characteristics as indicated below. Using these characteristics, you can design and manufacture highly accurate and highly rigid machines or equipment.

### Difference in Rated Load and Service Life

Since SR has a contact angle of 90°, its rated load and service life are different from those with a contact angle of 45°. When comparing model SR with a model that has a contact angle of 45° and when the same radial load is applied to the two models with the same ball diameter as shown in the figure below, the load applied to SR is 70% of the other model. As a result, the service life of SR is more than twice that of the other model.

Fig.1

### Difference in Accuracy

If a machining error (grinding error) occurs in the LM rail or LM block, it will affect the running accuracy. Assuming that there is a machining error of  $\Delta$  on the raceway, it results in an error in the radial direction, and the error with the contact angle of 45° (model HSR) is 1.4 times greater than that of the contact angle of 90° (model SR). As for the machining error resulting in horizontal direction error, the error with the contact angle of 45° is 1.22 times greater than the contact angle of 30°.

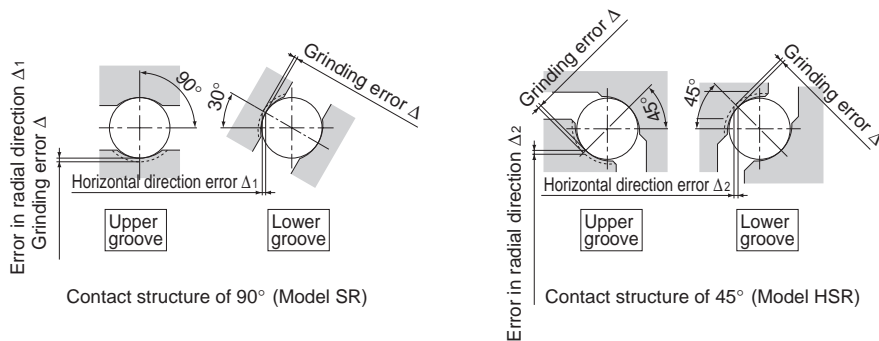

Fig.2 Machining Error and Accuracy

### Difference in Rigidity

The 90° contact angle adopted by model SR has a difference with the 45° contact angle also in rigidity. When the same radial load "P" is applied, the displacement in the radial direction with model SR is only 56% of that with the contact angle of 45°. Accordingly, where high rigidity in the radial direction is required, model SR is more advantageous. The figure below shows the difference in radial load and displacement.

Fig.3 Deflection under a Radial Load

Load and deflection when contact angles are not the same (Da=6.35mm)  
(deflection per ball)

Fig.4 Radial Load and Deflection

### Conclusion

As suggested above, model SR, which has a contact angle of 90° in the radial direction, is optimal for locations where the radial load is large, high rigidity is required or high running accuracy in the vertical and horizontal directions is required.

However, if the reverse radial load, the lateral load or the moment is large, we recommend model HSR, which has a contact angle of 45° (4-way equal load).

## Rated Loads in All Directions

Model SR is capable of receiving loads in four directions: radial, reverse radial and lateral directions.

The basic load ratings indicate the values in the radial directions in Fig.5, and their actual values are provided in the specification table for SR. The values in the reverse radial and lateral directions are obtained from Table1 below.

Fig.5

Table1 Rated Loads in All Directions with Model SR

Model No.	Direction	Basic dynamic load rating	Basic static load rating
SR 15 to 70	Radial direction	C	C <sub>0</sub>
	Reverse radial direction	C <sub>r</sub> =0.62C	C <sub>α</sub> =0.50C <sub>0</sub>
	Lateral directions	C <sub>T</sub> =0.56C	C <sub>0T</sub> =0.43C <sub>0</sub>
SR 85 to 150	Radial direction	C	C <sub>0</sub>
	Reverse radial direction	C <sub>r</sub> =0.78C	C <sub>α</sub> =0.71C <sub>0</sub>
	Lateral directions	C <sub>T</sub> =0.48C	C <sub>0T</sub> =0.35C <sub>0</sub>

## Equivalent Load

When the LM block of model SR receives loads in the reverse radial and lateral directions simultaneously, the equivalent load is obtained from the equation below.

$$P_E = X \cdot P_L + Y \cdot P_T$$

P<sub>E</sub> : Equivalent load (N)

: Reverse radial direction

: Lateral direction

P<sub>L</sub> : Reverse radial load (N)

P<sub>T</sub> : Lateral load (N)

X, Y : Equivalent factor (see Table2)

Table2 Equivalent Factor of Model SR

Model No.	P <sub>E</sub>	X	Y
SR 15 to 70	Equivalent load in reverse radial direction	1	1.155
	Equivalent load in lateral direction	0.866	1
SR 85 to 150	Equivalent load in reverse radial direction	1	2
	Equivalent load in lateral direction	0.5	1

## Structure and Features

Balls roll in four rows of raceways precision-ground on an LM rail and an LM block, and endplates incorporated in the LM block allow the balls to circulate. The raceways are cut into deep grooves that have a radius closer to that of the balls than in the conventional design, using special equipment and an extremely precise cutting technique. This design allows high rigidity, high vibration/impact resistance and high damping capacity, all of which are required for machine tools, thus making these models capable of bearing ultra-heavy loads.

### [Improved Damping Capacity]

While the machine tool (equipped with NR or NRS) is not cutting a workpiece during operation, the LM Guide travels normally and smoothly. While the machine tool is cutting the workpiece, the cutting force is applied to the LM Guide to increase and the contact area between the balls and the raceway, allowing an appropriate mixture of rolling and sliding motions to be achieved. Accordingly, the friction resistance is increased and the damping capacity is improved.

Since the absolute slip during the rolling and sliding motion is insignificant, it causes little wear and does not affect the service life.

### [Highly Rational LM Guide]

The excessively large differential slip occurring in a Gothic-arch groove does not happen with these models. They smoothly travel and achieve high positioning accuracy during fast feeding. During the cutting operation, appropriate slip occurs according to the cutting load, the rolling resistance is increased and the damping capacity is increased. Thus, models NR and NRS are highly rational LM Guides.

### [High Rigidity]

To increase the rigidity of the LM block and the LM rail, which may deteriorate the overall rigidity of the LM Guide in the reverse radial and lateral directions, THK made full use of FEM to achieve optimal design within the limited dimensional range.

For both the radial type model NR and the 4-way equal load type model NRS, THK offers two types with the same dimensions and different characteristics. It allows you to select the desired type according to the application.

### [Ultra-heavy Load]

Since the curvature of the raceway is approximated to the ball diameter, the ball contact area under a load is increased and the LM Guide is capable of receiving an ultra-heavy load.

## Types and Features

### Models NR-R/NRS-R

With this type, the LM block has a smaller width (W) and tapped holes. Used in places where the space for table width is limited.

Specification Table⇒B-94/B-96

### Models NR-A/NRS-A

The flange of its LM block has tapped holes.

Specification Table⇒B-98/B-100

### Models NR-B/NRS-B

The flange of the LM block has through holes. Used in places where the table cannot have through holes for mounting bolts.

Specification Table⇒B-102/B-104

## Features of Each Model

### Ultra-heavy Load Type Models NR/NRS

### Models NR-LR/NRS-LR

The LM block has the same cross-sectional shape as models NR-R/NRS-R, but has a longer overall LM block length (L) and a greater rated load.

Specification Table⇒B-94/B-96

LM Guide

### Models NR-LA/NRS-LA

The LM block has the same cross-sectional shape as models NR-A/NRS-A, but has a longer overall LM block length (L) and a greater rated load.

Specification Table⇒B-98/B-100

### Models NR-LB/NRS-LB

The LM block has the same cross-sectional shape as models NR-B/NRS-B, but has a longer overall LM block length (L) and a greater rated load.

Specification Table⇒B-102/B-104

## Characteristics of Models NR and NRS

### [Increased Rigidity in Major Load Directions]

The structure with a contact angle of  $90^\circ$  used in model NR differs from that with a  $45^\circ$  contact angle also in rigidity. Under the same radial load  $P$ , the displacement in the radial direction with model NR having a contact angle of  $90^\circ$  is 44% less than the  $45^\circ$ .

Fig.1 Deflection under a Radial Load

Fig.2 shows the difference in radial load and displacement. Accordingly, where high rigidity in the radial direction is required, model NR is more advantageous.

Load and deflection when contact angles are not the same ( $Da=6.35\text{mm}$ )  
(deflection per 24 balls)

Fig.2 Radial Load and Deflection (normal clearance, no pre-load)

### [Increased Rigidity in the Lateral and Reverse-radial Directions]

Since with LM Guide model NR, the distance "H" between the rail bottom and the lower-groove balls (balls receiving lateral loads) is short, the ratio between the rail width "W" and the distance "H" is small, and the distance "T" between the LM rail mounting bolt seat and the LM rail bottom is short. Accordingly, the deformation of the LM rail under a lateral load is minimal, and the rigidity in the lateral directions is increased.

Since the dimension "B" of the LM block is short and the thickness "A" is large, the lateral extension of the LM block under a reverse radial or lateral load is minimized. This structure allows the rigidity in the reverse radial direction to be increased.

In comparison to the old model with the same model number, the ball diameter of NR is smaller and the number of effective balls is approximately 1.3 times greater, thus increasing the static rigidity.

Radial type structure

Fig.3 Cross Section of Model NR

Features of Each Model

Ultra-heavy Load Type Models NR/NRS

[Comparison of Contact Surface and Internal Stress between Different Contact Structures]

As shown in Fig.4, the contact area and the internal stress of a ball greatly vary depending on the shape of contact surface.

With the conventional roller guide, the effective length is shorter than the apparent value due to the retention of the rollers. Additionally, the change of stress distribution in the contact section caused by a mounting error significantly affects the differential slip.

Fig.4 Comparison of Contact Surface ( $\phi 6.350$  ball,  $\phi 6 \times 6l$  roller)

## Rated Loads in All Directions

Models NR/NRS are capable of receiving loads in all four directions: radial, reverse radial and lateral directions.

The basic load ratings of model NR are indicated by the values in the radial directions in Fig.5, and their actual values are provided in the specification table for NR/NRS. The values in the reverse radial and lateral directions are obtained from table 1 below.

The basic load ratings of model NRS are equal in all the four directions (radial, reverse radial and lateral directions), and their actual values are provided in the specification table for NR/NRS.

Fig.5

Table1 Rated Loads in All Directions with Model NR

Direction	Basic dynamic load rating	Basic static load rating
Radial direction	C	C <sub>0</sub>
Reverse radial direction	C <sub>L</sub> =0.78C	C <sub>0L</sub> =0.71C <sub>0</sub>
Lateral directions	C <sub>T</sub> =0.48C	C <sub>0T</sub> =0.45C <sub>0</sub>

## Equivalent Load

When the LM block of model NR receives loads in the reverse radial and lateral directions simultaneously, the equivalent load is obtained from the equation below.

$$P_E = X \cdot P_L + Y \cdot P_T$$

P<sub>E</sub> : Equivalent load (N)  
 : Reverse radial direction  
 : Lateral direction

P<sub>L</sub> : Reverse radial load (N)

P<sub>T</sub> : Lateral load (N)

X, Y : Equivalent factor (see Table2)

Table2 Equivalent Factor of Model NR

P <sub>E</sub>	X	Y
Equivalent load in reverse radial direction	1	2
Equivalent load in lateral direction	0.5	1

When the LM block of model NRS receives loads in the reverse radial and lateral directions simultaneously, the equivalent load is obtained from the equation below.

$$P_E = P_R (P_L) + P_T$$

P<sub>E</sub> : Equivalent load (N)  
 : Radial direction  
 : Reverse radial direction  
 : Lateral direction

P<sub>R</sub> : Radial load (N)

P<sub>L</sub> : Reverse radial load (N)

P<sub>T</sub> : Lateral load (N)

## Structure and Features

Balls roll in four rows of raceways precision-ground on an LM rail and an LM block, and endplates incorporated in the LM block allow the balls to circulate.

Since retainer plates hold the balls, they do not fall off even if the LM rail is pulled out. (except models HRW 12 and 14LR).

Each row of balls is placed at a contact angle of  $45^\circ$  so that the rated loads applied to the LM block are uniform in the four directions (radial, reverse radial and lateral directions), enabling the LM Guide to be used in all orientations. In addition, the LM block can receive a well-balanced preload, increasing the rigidity in four directions while maintaining a constant, low friction coefficient. In a low center of gravity structure with a large rail width and a low overall height, this model can be used in places where space saving is required or high rigidity against a moment is required even in a single axis configuration.

### [Compact, Heavy Load]

Since the number of effective balls is large, this model is highly rigid in all directions. It can adequately receive a moment even in a single rail configuration.

Additionally, since the second moment of inertia of the rail is large, the rigidity in the lateral directions is also high. Accordingly, it does not need reinforcement such as a side support.

### [Self-adjustment Capability]

The self-adjustment capability through front-to-front configuration of THK's unique circular-arc grooves (DF set) enables a mounting error to be absorbed even under a preload, thus to achieve highly accurate, smooth straight motion.

## Rated Loads in All Directions

Model HRW is capable of receiving loads in four directions: radial, reverse radial and lateral directions.

The basic load ratings of model HRW 17 to 60 are equal in all the four directions (radial, reverse radial and lateral directions), and their actual values are provided in the specification table for HRW.

The basic load ratings of models HRW 12 and 14 indicate the values in the radial directions in Fig.1, and their actual values are provided in the specification table for HRW. The values in the reverse radial and lateral directions are obtained from Table1 below.

Fig.1

Table1 Rated Loads in All Directions with Models HRW 12 and 14

Direction	Basic dynamic load rating	Basic static load rating
Radial direction	C	C <sub>0</sub>
Reverse radial direction	C <sub>L</sub> =0.78C	C <sub>0L</sub> =0.71C <sub>0</sub>
Lateral directions	C <sub>T</sub> =0.48C	C <sub>0T</sub> =0.35C <sub>0</sub>

## Equivalent Load

When the LM block of models HRW 17 to 60 receives loads in the reverse radial and lateral directions simultaneously, the equivalent load is obtained from the equation below.

$$P_E = P_R (P_L) + P_T$$

- P<sub>E</sub> : Equivalent load (N)  
 : Radial direction  
 : Reverse radial direction  
 : Lateral direction
- P<sub>R</sub> : Radial load (N)  
 P<sub>L</sub> : Reverse radial load (N)  
 P<sub>T</sub> : Lateral load (N)

When the LM block of models HRW 12 and 14 receives loads in the reverse radial and lateral directions simultaneously, the equivalent load is obtained from the equation below.

$$P_E = X \cdot P_L + Y \cdot P_T$$

- P<sub>E</sub> : Equivalent load (N)  
 : Reverse radial direction  
 : Lateral direction
- P<sub>L</sub> : Reverse radial load (N)  
 P<sub>T</sub> : Lateral load (N)  
 X, Y : Equivalent factor (see Table2)

Table2 Equivalent Factor of Models HRW12 and 14

P <sub>E</sub>	X	Y
Equivalent load in reverse radial direction	1	2
Equivalent load in lateral direction	0.5	1

## Features of Each Model

### Miniature Type Models RSR/RSR-W

---

## Structure and Features

---

With models RSR and RSR-W, balls roll in two rows of raceways precision-ground on an LM rail and an LM block, and endplates incorporated in the LM block allow the balls to circulate.

Balls circulate in a compact structure and perform infinite straight motion with no limit in stroke.

The LM block is designed to have a shape with high rigidity in a limited space, and in combination with large-diameter balls, demonstrates high rigidity in all directions.

#### [Ultra Compact]

The absence of cage displacement, a problem that cross-roller guides and types of ball slides with finite stroke tend to cause, make these models highly reliable LM systems.

#### [Capable of Receiving Loads in All Directions]

These models are capable of receiving loads in all directions, and a single-rail guide can adequately operate under a small moment load. Model RSR-W, in particular, has a greater number of effective balls and a broader LM rail to increase its rigidity against a moment. Thus, it achieves a more compact structure and more durable straight motion than a pair of linear bushes in parallel use.

#### [Stainless Steel Type also Available]

A special type where LM block, LM rail and balls are made of stainless steel is also available.

## Types and Features

### Models RSR/RSR-K/RSR-V

Specification Table⇒B-116

This model is a standard type.

### Models RSR-W/WV

Specification Table⇒B-118

These models have greater overall LM block lengths (L), broader widths (W) and greater rated loads and permissible moments than standard types.

### Model RSR-N

Specification Table⇒B-114

It has a longer overall LM block length (L) and a greater rated load than standard types.

## Model RSR-WN

It has a longer overall LM block length (L), a greater rated load than standard types. Achieves the greatest load capacity among the miniature type LM Guide models.

Specification Table⇒B-118

LM Guide

## Comparison of Model RSR-W with Other Model Numbers

### [Locations where a Pair of Linear Bushes are Used]

- Unlike the linear bushes, model RSR-W can be used in a single-rail configuration and allows space saving.
- Since model RSR-W has more load-bearing balls per row and wider LM block and LM rail, thus to achieve high rigidity against an overhung load.
- Accuracy can be achieved simply by mounting the LM rail using bolts. Therefore, the assembly time can be shortened.

#### Example of comparing model RSR12W with model LM 10 in use

Fig.1

### [Locations where a Cross-roller Table is Used]

- Does not show cage displacement even with vertical mount, and capable of performing infinite straight motion.
- Eliminates the need for difficult clearance adjustment and achieves long-term, smooth motion over a long period of time.
- Since the LM block width is large, the model can be used as a miniature table without any modification.

#### Example of comparing model RSR9WV with model VRM1035 in use

Fig.2

## Rated Loads in All Directions

Model RSR is capable of receiving loads in four directions: radial, reverse radial and lateral directions.

The basic load ratings of models RSR3 to 9 are uniform in the four directions (radial, reverse radial and lateral directions), and their actual values are provided in the specification table for RSR.

The basic load ratings of models RSR12 to 20 indicate the values in the radial direction in Fig.3, and their actual values are provided in the specification table for RSR. The values in the reverse radial and lateral directions are obtained from Table1 below.

Fig.3

Table1 Basic Load Ratings of Models RSR12 to 20 in All Directions

Direction	Basic dynamic load rating	Basic static load rating
Radial direction	C	C <sub>0</sub>
Reverse radial direction	C <sub>L</sub> =0.78C	C <sub>0L</sub> =0.70C <sub>0</sub>
Lateral directions	C <sub>T</sub> =0.78C	C <sub>OT</sub> =0.71C <sub>0</sub>

## Equivalent Load

When the LM block of models RSR3 to 9 receives loads in all four directions simultaneously, the equivalent load is obtained from the equation below.

$$P_E = P_R (P_L) + P_T$$

P<sub>E</sub> : Equivalent load (N)  
 : Radial direction  
 : Reverse radial direction  
 : Lateral direction

P<sub>R</sub> : Radial load (N)

P<sub>L</sub> : Reverse radial load (N)

P<sub>T</sub> : Lateral load (N)

When the LM block of model RSR12 to 20 receives loads in the radial and lateral directions, or the reverse radial and lateral directions, simultaneously, the equivalent load is obtained from the equation below.

$$P_E = X \cdot P_R (P_L) + Y \cdot P_T$$

P<sub>E</sub> : Equivalent load (N)  
 : Radial direction  
 : Reverse radial direction  
 : Lateral direction

P<sub>R</sub> : Radial load (N)

P<sub>L</sub> : Reverse radial load (N)

P<sub>T</sub> : Lateral load (N)

X, Y : Equivalent factor  
 (see Table2 and Table3)

Table2 Equivalent Factor of Models RSR12 to 20  
 (When radial and lateral loads are applied)

P <sub>E</sub>	X	Y
Equivalent load in the radial direction	1	0.83
Equivalent load in lateral direction	1.2	1

Table3 Equivalent Factor of Models RSR12 to 20  
 (When reverse radial and lateral loads are applied)

P <sub>E</sub>	X	Y
Equivalent load in reverse radial direction	1	0.99
Equivalent load in lateral direction	1.01	1

---

## Accuracy of the Mounting Surface

---

Model RSR uses Gothic arch grooves in the ball raceways. When two rails of RSR are used in parallel, any error in accuracy of the mounting surface may increase rolling resistance and negatively affect the smooth motion of the guide. For specific accuracy of the mounting surface, see Permissible Error of the Mounting Surface on A-333.

When using this model in locations where it is difficult to obtain satisfactory accuracy of the mounting surface, we recommend using types RSR···A (semi standard) whose ball raceways have circular-arc grooves. (avoid using these types in a single-rail configuration).

For specific accuracy of the mounting surface for types RSR···A, Permissible Error of the Mounting Surface is on A-333.

---

## Flatness of the Mounting Surface

---

## Features of Each Model

### Miniature Type (Low Cost Type) Model RSR-Z

## Structure and Features

Balls roll in two rows of raceways precision-ground on an LM rail and an LM block, and endplates incorporated in the LM block allow the balls to circulate.

Balls of model RSR-Z circulate in a compact structure and perform infinite straight motion with no limit in stroke.

Also, it has the same dimensions as models RSR/RSR-W, but achieves a lighter weight and a lower price.

#### [Lightweight]

Since part of the LM block body uses a resin material, the block mass is reduced by up to 28% from the conventional type model RSR-V. This makes RSR-Z a low-inertia type.

#### [Smooth Motion]

The unique structure of the endplate allows the balls to circulate smoothly and infinitely.

#### [Highly Corrosion Resistant]

Since the LM block, LM rail and balls use stainless steel, which is highly corrosion resistant, this model is optimal for clean room applications.

#### [Low Noise]

Since the unloaded ball path is made of resin, there is no metal to metal contact and low noise is achieved.

Fig.1 Noise Levels of Models RSR12Z and RSR12V

---

## Types and Features

---

### Model RSR-Z

[Specification Table⇒B-122](#)

This model is a standard type.

---

### Models RSR-WZ

[Specification Table⇒B-124](#)

It has a longer overall LM block length (L), a broader width (W) and greater rated load and permissible moment than RSR-Z.

**Features of Each Model**

**Miniature Type (Low Cost Type) Model RSR-Z**

**Rated Loads in All Directions**

Model RSR-Z is capable of receiving loads in four directions: radial, reverse radial and lateral directions.

The basic load ratings of models RSR7Z/WZ and 9Z/WZ are uniform in the four directions (radial, reverse radial and lateral directions), and their actual values are provided in the specification table for RSR-Z.

The basic load ratings of models RSR12Z/WZ and 15Z/WZ indicate the values in the radial direction in Fig.2, and their actual values are provided in the specification table for RSR-Z. The values in the reverse radial and lateral directions are obtained from Table1.

Fig.2

Table1 Basic Load Ratings of Models RSR12Z/WZ and 15Z/WZ in All Directions

Direction	Basic dynamic load rating	Basic static load rating
Radialdirection	C	C <sub>0</sub>
Reverse radial direction	C <sub>L</sub> =0.78C	C <sub>0L</sub> =0.70C <sub>0</sub>
Lateraldirections	C <sub>T</sub> =0.78C	C <sub>0T</sub> =0.71C <sub>0</sub>

**Equivalent Load**

When the LM block of models RSR7Z/WZ and 9Z/WZ receives loads in all four directions simultaneously, the equivalent load is obtained from the equation below.

$$P_E = P_R (P_L) + P_T$$

- P<sub>E</sub> : Equivalent load (N)
- : Radial direction
- : Reverse radial direction
- : Lateral direction
- P<sub>R</sub> : Radial load (N)
- P<sub>L</sub> : Reverse radial load (N)
- P<sub>T</sub> : Lateral load (N)

When the LM block of model RSR12Z/WZ and 15Z/WZ receives loads in the radial and lateral directions, or the reverse radial and lateral directions, simultaneously, the equivalent load is obtained from the equation below.

$$P_E = X \cdot P_R (P_L) + Y \cdot P_T$$

- P<sub>E</sub> : Equivalent load (N)
- : Radial direction
- : Reverse radial direction
- : Lateral direction

## Features of Each Model

### Miniature Type (with a Ball Retainer) Model RSH

## Structure and Features

Balls roll in two rows of raceways precision-ground on an LM rail and an LM block, and endplates incorporated in the LM block allow the balls to circulate. Since a retainer holds the balls, they will not fall off even if the LM block is removed from the LM rail.

With the Miniature Type LM Guide Equipped with a Ball Retainer model RSH, balls circulate in a compact structure and perform infinite straight motion with no limit in stroke. The LM block is designed to have a shape with high rigidity in a limited space, and in combination with large-diameter balls, demonstrates high rigidity in all directions.

### [Miniature Size]

This model is a highly reliable, ultra compact LM Guide that responds to weight saving and space saving.

### [Capable of Receiving Loads in All Directions]

This model is capable of receiving loads in all directions, and has a high load capacity because of large-diameter balls incorporated in two rows of raceways.

### [Highly Corrosion Resistant]

Since the LM block, LM rail and balls use stainless steel, which is highly corrosion resistant, this model is optimal for clean room applications.

### [Equipped with a Ball Retainer]

The LM block contains a retainer capable of preventing balls from falling off. Since the balls will not fall even if the LM block is removed from the LM rail, you can use this LM Guide at ease.

## Types and Features

### Model RSH

This model is a standard type.

[Specification Table⇒B-128](#)

## Rated Loads in All Directions

Model RSH is capable of receiving loads in four directions: radial, reverse radial and lateral directions.

The basic load ratings of models RSH7 and 9 are uniform in the four directions (radial, reverse radial and lateral directions), and their actual values are provided in the specification table for RSH.

The basic load ratings of model RSH12 indicate the values in the radial direction in Fig.1, and their actual values are provided in the specification table for RSH. The values in the reverse radial and lateral directions are obtained from Table1 below.

Fig.1

Table1 Basic Load Ratings of Model RSH12 in All Directions

Direction	Basic dynamic load rating	Basic static load rating
Radial direction	C	C <sub>0</sub>
Reverse radial direction	C <sub>L</sub> =0.78C	C <sub>0L</sub> =0.70C <sub>0</sub>
Lateral directions	C <sub>T</sub> =0.78C	C <sub>0T</sub> =0.71C <sub>0</sub>

## Equivalent Load

When the LM block of models RSH7 and 9 receives loads in all four directions simultaneously, the equivalent load is obtained from the equation below.

$$P_E = P_R (P_L) + P_T$$

- P<sub>E</sub> : Equivalent load (N)
- : Radial direction
- : Reverse radial direction
- : Lateral direction
- P<sub>R</sub> : Radial load (N)
- P<sub>L</sub> : Reverse radial load (N)
- P<sub>T</sub> : Lateral load (N)

When the LM block of model RSH12 receives loads in the radial and lateral directions, or the reverse radial and lateral directions, simultaneously, the equivalent load is obtained from the equation below.

$$P_E = X \cdot P_R (P_L) + Y \cdot P_T$$

- P<sub>E</sub> : Equivalent load (N)
  - : Radial direction
  - : Reverse radial direction
  - : Lateral direction
  - P<sub>R</sub> : Radial load (N)
  - P<sub>L</sub> : Reverse radial load (N)
  - P<sub>T</sub> : Lateral load (N)
  - X, Y : Equivalent factor
- (see Table2 and Table3)

Table2 Equivalent Factor of Model RSH12  
(when radial and lateral loads are applied)

P <sub>E</sub>	X	Y
Equivalent load in the radial direction	1	0.83
Equivalent load in lateral direction	1.2	1

Table3 Equivalent Factor of Model RSH12  
(when reverse radial and lateral loads are applied)

P <sub>E</sub>	X	Y
Equivalent load in reverse radial direction	1	0.99
Equivalent load in lateral direction	1.01	1

## Features of Each Model

### Miniature Type (with a Ball Retainer) Model RSH-Z

---

## Structure and Features

---

Balls roll in two rows of raceways precision-ground on an LM rail and an LM block, and endplates incorporated in the LM block allow the balls to circulate. Since a retainer holds the balls, they will not fall off even if the LM block is removed from the LM rail.

With model RSH-Z, balls circulate in a compact structure and perform infinite straight motion with no limit in stroke.

Also, it has the same dimensions as the conventional model, but achieves a lower price.

#### [Equipped with a Ball Retainer]

Model RSH-Z has a retainer capable of preventing balls from falling off. Since the balls will not fall even if the LM block is removed from the LM rail, you can use this LM Guide at ease.

#### [Lightweight]

Since part of the LM block body uses a resin material, the block mass is reduced by up to 30% from the conventional type. This makes RSH-Z a low-inertia type.

#### [Highly Corrosion Resistant]

Since the LM block, LM rail and balls use stainless steel, which is highly corrosion resistant, this model is optimal for clean room applications.

#### [Low Noise]

Since the unloaded ball path is made of resin, there is no metal to metal contact and low noise is achieved.

---

## Types and Features

---

### Model RSH-Z

[Specification Table⇒B-132](#)

This model is a standard type.

---

### Model RSH-WZ

[Specification Table⇒B-134](#)

This model has a greater overall LM block length (L), broader width (W) and greater rated load and permissible moment than model RSH-Z.

**Features of Each Model**

**Miniature Type (with a Ball Retainer) Model RSH-Z**

**Rated Loads in All Directions**

Model RSH-Z is capable of receiving loads in four directions: radial, reverse radial and lateral directions.

The basic load ratings of models RSH7Z/WZ and 9Z/WZ are uniform in the four directions (radial, reverse radial and lateral directions), and their actual values are provided in the specification table for RSH-Z.

The basic load ratings of models RSH12Z/WZ and 15Z/WZ indicate the values in the radial direction in Fig.1, and their actual values are provided in the specification table for RSH-Z. The values in the reverse radial and lateral directions are obtained from Table1 below.

Fig.1

Table1 Basic Load Ratings of Models RSH12Z/WZ and 15Z/WZ in All Directions

Direction	Basic dynamic load rating	Basic static load rating
Radial direction	C	C <sub>0</sub>
Reverse radial direction	C <sub>L</sub> =0.78C	C <sub>0L</sub> =0.70C <sub>0</sub>
Lateral directions	C <sub>T</sub> =0.78C	C <sub>0T</sub> =0.71C <sub>0</sub>

**Equivalent Load**

When the LM block of models RSH7Z/WZ and 9Z/WZ receives loads in all four directions simultaneously, the equivalent load is obtained from the equation below.

$$P_E = P_R ( P_L ) + P_T$$

- P<sub>E</sub> : Equivalent load (N)
- : Radial direction
- : Reverse radial direction
- : Lateral direction
- P<sub>R</sub> : Radial load (N)
- P<sub>L</sub> : Reverse radial load (N)
- P<sub>T</sub> : Lateral load (N)

When the LM block of models RSH12Z/WZ and 15Z/WZ receives loads in the radial and lateral directions, or the reverse radial and lateral directions, simultaneously, the equivalent load is obtained from the equation below.

$$P_E = X \cdot P_R ( P_L ) + Y \cdot P_T$$

- P<sub>E</sub> : Equivalent load (N)
- : Radial direction
- : Reverse radial direction
- : Lateral direction
- P<sub>R</sub> : Radial load (N)
- P<sub>L</sub> : Reverse radial load (N)
- P<sub>T</sub> : Lateral load (N)
- X, Y : Equivalent factor

(see Table2 and Table3)

Table2 Equivalent Factor of Models RSH12Z/WZ and 15Z/WZ (when radial and lateral loads are applied)

P <sub>E</sub>	X	Y
Equivalent load in the radial direction	1	0.83
Equivalent load in lateral direction	1.2	1

Table3 Equivalent Factor of Models RSH12Z/WZ and 15Z/WZ (when reverse radial and lateral loads are applied)

P <sub>E</sub>	X	Y
Equivalent load in reverse radial direction	1	0.99
Equivalent load in lateral direction	1.01	1

## Structure and Features

Balls roll in two rows of raceways precision-ground on an LM rail and an LM block, and endplates incorporated in the LM block allow the balls to circulate. Since retainer plates hold the balls, they do not fall off.

Because of the angular contact structure where two rows of balls rolling on the LM rail each contact the raceway at 45°, the same load can be applied in four directions (radial, reverse radial and lateral directions) if a set of LM rails and LM block is mounted on the same plane (i.e., when two LM rails are combined with an LM block on the same plane). Furthermore, since the sectional height is low, a compact and stable linear guide mechanism is achieved.

This structure makes clearance adjustment relatively easy, and is highly capable of absorbing a mounting error.

### [Easy Installation]

Model HR is easier to adjust a clearance and achieve more accuracy than cross-roller guides.

### [Self-adjustment Capability]

Even if the parallelism or the level between the two rails is poorly established, the self-adjustment capability through front-to-front configuration of THK's unique circular-arc grooves (DF set) enables a mounting error to be absorbed and smooth straight motion to be achieved even under a preload.

### [4-way Equal Load Type]

When the two rails are mounted in parallel, each row of balls is placed at a contact angle of 45° so that the rated loads applied to the LM block are uniform in the four directions (radial, reverse radial and lateral directions), enabling the LM Guide to be used in various orientations and in applications.

### [Sectional Dimensions Approximate to Cross-roller Guides]

Since model HR is an infinite motion type whose retainer plate does not move, it is not associated with cage displacement that occurs with cross-roller guides. In addition, the sectional shape of model HR is approximate to that of cross-roller guides, therefore, its components are interchangeable with that of cross-roller guides.

### [Stainless Steel Type also Available]

A special type whose LM block, LM rail and balls are made of stainless steel is also available.

## Types and Features

### Model HR - Heavy-load Type

The LM blocks can be mounted from the top and the bottom.

Specification Table⇒B-138

### Model HR-T-Ultra-heavy Load Type

Has the same cross-sectional shape as model HR, but has a greater overall LM block length (L) and a higher load rating.

Specification Table⇒B-140

## Features of Each Model

Separate Type (4-way Equal Load) Model HR

### Rated Loads in All Directions

When installed, one set of model HR is capable of receiving loads in all four directions: radial, reverse radial and lateral directions.

The basic load ratings of an installed set of model HR are equal in all four directions (radial, reverse radial and lateral directions). The basic load ratings in the specification table for model HR indicate the values in the radial direction per LM block as shown in Fig.1.

Fig.1

### Equivalent Load

When the LM block of model HR receives loads in the reverse radial and lateral directions simultaneously, the equivalent load is obtained from the equation below.

$$P_E = P_R (P_L) + \frac{1}{2} P_T$$

- $P_E$  : Equivalent load (N)  
       : Radial direction  
       : Reverse radial direction  
       : Lateral direction  
 $P_R$  : Radial load (N)  
 $P_L$  : Reverse radial load (N)  
 $P_T$  : Lateral load (N)

### Service Life

For details, see A-100.

## Example of Clearance Adjustment

Design the clearance adjustment bolt so that it presses the center of the side face of the LM block.

a. Using an adjustment screw

Normally, an adjustment screw is used to press the LM block.

b. Using tapered gibs

When high accuracy and high rigidity are required, use tapered gibs 1) and 2).

c. Using an eccentric pin

A type using an eccentric pin to adjust the clearance is also available.

## Accuracy Standards

## Features of Each Model

### Separate Type (Radial) Model GSR

---

## Structure and Features

---

Balls roll in two rows of raceways precision-ground on an LM rail and an LM block, and endplates incorporated in the LM block allow the balls to circulate. Since retainer plates hold the balls, they do not fall off.

As the top face of the LM block is inclined, a clearance is eliminated and an appropriate preload is applied simply by securing the LM block with mounting bolts.

Model GSR has a special contact structure using circular-arc grooves. This increases self-adjusting capability and makes GSR an optimal model for places associated with difficulty establishing high accuracy and for general industrial machinery.

#### [Interchangeability]

Both the LM block and LM rail are interchangeable and can be stored separately. Therefore, it is possible to store a long-size LM rail and cut it to a desired length before using it.

#### [Compact]

Since model GSR has a low center of gravity structure with a low overall height, the machine can be downsized.

#### [Capable of Receiving a Load in any Direction]

The ball contact angle is designed so that this model can receive a load in any direction. As a result, it can be used in places where a reverse radial load, lateral load or a moment in any direction is applied.

---

## Types and Features

---

### Model GSR-T

[Specification Table⇒B-146](#)

This model is a standard type.

---

### Model GSR-V

[Specification Table⇒B-146](#)

A space-saving type that has the same cross-sectional shape as GSR-T, but has a shorter overall LM block length (L).

## Rated Loads in All Directions

Model GSR is capable of receiving loads in four directions: radial, reverse radial and lateral directions.

The basic load ratings indicate the values in the radial direction in Fig.1, and their actual values are provided in the specification table for GSR. The values in the radial direction, tensile lateral direction and compressive lateral direction are obtained from Table1.

Note) Not available for a single-axis configuration.

Fig.1

Table1 Basic Load Ratings of Model GSR in All Directions

Direction	Basic dynamic load rating	Basic static load rating
Radial direction	C	C <sub>0</sub>
Reverse radial direction	C <sub>L</sub> =0.93C	C <sub>OL</sub> =0.90C <sub>0</sub>
Tensile lateral direction	C <sub>Tt</sub> =0.84C	C <sub>0Tt</sub> =0.78C <sub>0</sub>
Compressive lateral direction	C <sub>Tc</sub> =0.93C	C <sub>0Tc</sub> =0.90C <sub>0</sub>

## Equivalent Load

When the LM block of model GSR receives loads in the radial, tensile lateral, reverse radial and compressive lateral directions simultaneously, the equivalent load is obtained from the equation below.

$$P_E = X \cdot P_R + Y \cdot P_{Tt}$$

$$P_E = P_L + P_{Tc}$$

- P<sub>E</sub> : Equivalent load (N)
- : Radial direction
- : Reverse radial direction
- : Tensile lateral direction
- : Compressive lateral direction
- P<sub>R</sub> : Radial load (N)
- P<sub>L</sub> : Reverse radial load (N)
- P<sub>Tt</sub> : Tensile lateral load (N)
- P<sub>Tc</sub> : Compressive lateral direction load (N)
- X, Y : Equivalent factor (see Table2)

Table2 Equivalent Factor of Model GSR  
 (when radial and tensile lateral loads are applied)

P <sub>E</sub>	X	Y

## Features of Each Model

Separate Type (Radial) Model GSR-R

## Structure and Features

Balls roll in two rows of raceways precision-ground on an LM rail and an LM block, and endplates incorporated in the LM block allow the balls to circulate. Since retainer plates hold the balls, they do not fall off.

As the top face of the LM block is inclined, a clearance is eliminated and an appropriate preload is applied simply by securing the LM block with mounting bolts.

Model GSR-R is based on model GSR, but has rack teeth on the LM rail. This facilitates the design and assembly of drive mechanisms.

### [Reduced Machining and Assembly Costs]

The single-piece structure integrating the LM rail (linear guide) and rack (drive) reduces labor and time for machining the rack mounting surface and assembling and adjusting the guide system, thus to achieve significant cost reduction.

### [Easy Designing]

The travel distance per turn of the pinion is specified by the integer value. This makes it easy to calculate the travel distance per pulse when the LM Guide is used in combination with a stepping motor or servomotor.

### [Space Saving]

Since the rail has a rack, the machine size can be reduced.

### [Long Stroke]

The end faces of the LM rail are machined for jointed use. To obtain a long stroke, simply joint LM rails of the standard length.

### [High Durability]

The rack tooth has a width equal to the LM rail height, the rack uses high-grade steel with proven performance and the tooth surface are heat-treated, thereby to ensure high durability.

## Types and Features

### Model GSR-R (Rail with Rack)

Specification Table⇒B-150

Since the thrust load on the pinion shaft can be kept low due to rack-pinion meshing, it is easy to design systems with pinion shaft bearings and tables that are not so rigid.

### Rated Loads in All Directions

Model GSR-R is capable of receiving loads in four directions: radial, reverse radial and lateral directions.

The basic load ratings indicate the values in the radial direction in Fig.1, and their actual values are provided in the specification table for GSR-R. The values in the radial direction, tensile lateral direction and compressive lateral direction are obtained from Table1.

Fig.1

Table1 Basic Load Ratings of Model GSR-R in All Directions

Direction	Basic dynamic load rating	Basic static load rating
Radial direction	C	C <sub>0</sub>
Reverse radial direction	C <sub>L</sub> =0.93C	C <sub>0L</sub> =0.90C <sub>0</sub>
Tensile lateral direction	C <sub>Tt</sub> =0.84C	C <sub>0Tt</sub> =0.78C <sub>0</sub>
Compressive lateral direction	C <sub>Tc</sub> =0.93C	C <sub>0Tc</sub> =0.90C <sub>0</sub>

## Equivalent Load

When the LM block of model GSR-R receives loads in the radial, tensile lateral, reverse radial and compressive lateral directions simultaneously, the equivalent load is obtained from the equation below.

$$P_E = X \cdot P_R + Y \cdot P_{Tt}$$

$$P_E = P_L + P_{Tc}$$

- $P_E$  : Equivalent load (N)  
 : Radial direction  
 : Reverse radial direction  
 : Tensile lateral direction  
 : Compressive lateral direction  
 $P_R$  : Radial load (N)  
 $P_L$  : Reverse radial load (N)  
 $P_{Tt}$  : Tensile lateral load (N)  
 $P_{Tc}$  : Compressive lateral direction load (N)  
 $X, Y$  : Equivalent factor (see Table2)

Table2 Equivalent Factor of Model GSR-R  
(when radial and tensile lateral loads are applied)

$P_E$	X	Y
Equivalent load in the radial direction	1	1.28
Equivalent load in tensile lateral direction	0.781	1

## Service Life

For details, see A-100.

## Accuracy Standards

For details, see A-125.

## Shoulder Height of the Mounting Base and the Corner Radius

For details, see A-331.

## Error Allowance in the Parallelism between Two Rails

For details, see A-334.

## Error Allowance in Vertical Level between Two Rails

For details, see A-337.

## Rack and Pinion

### [Joining Two or More Rails]

The end faces of the rail with rack are machined so that a clearance is left after assembly in order to facilitate the assembly.

Use of a special jig as shown in Fig.2 will make the connection easier.

(THK also offers the rack-aligning jig.)

Fig.2 Rack Connection Method

### [Reworking the Pinion Hole]

Only the teeth of the reworkable pinion-hole-diameter type (type C) are heat-treated. The hole and keyway can therefore be reworked by the user to the desired diameter and shape.

When reworking the pinion hole, be sure to take the following into account.

The material of the reworkable hole diameter type (type C): S45C

- (1) When chucking the teeth of a reworkable hole diameter type, use a jaw scroll chuck or something like it to maintain the tooth profile.
- (2) The pinion is produced using the center of the hole as a reference point. The center of the hole should therefore be used as a reference point when the pinion is aligned.  
When checking the pinion runout, refer to the boss sides.
- (3) Keep the reworked hole diameter within roughly 60 to 70% of the boss diameter.

Fig.3

### [Lubricating the Rack and Pinion]

To ensure smooth sliding on tooth surfaces and prevent wear, the teeth should be provided with a lubricant.

Note) Use a lubricant of the same type as that contained in the LM Guide.

Features of Each Model

Separate Type (Radial) Model GSR-R

[Checking Strength]

The strength of the assembled rack and pinion must be checked in advance.

- (1) Calculate the maximum thrust acting on the pinion.
- (2) Divide the permissible power transmission capacity of the pinion to be used (Table3) by an overload factor (Table4).
- (3) By comparing the thrust acting on the pinion obtained in step 1 with the pinion power transmission capacity obtained in step 2, make sure the applied thrust does not exceed the permissible power transmission capacity.

[Example of calculation]

Model GSR-R is used in a horizontal conveyance system receiving a medium impact (assuming external load to be zero).

● Conditions

Subject model No. (pinion) GP6-20A  
 Mass (table + work) m=100kg  
 Speed v=1 m/s  
 Acceleration/deceleration time T<sub>1</sub> =0.1 s

● Consideration

- (1) Calculating the maximum thrust  
 Calculated the thrust during acceleration/deceleration.

$$F_{max} = m \cdot \frac{v}{T_1} = 1.00kN$$

- (2) Permissible power transmission capacity of the pinion

$$P_{max} = \frac{\text{Permissible power transmission capacity (see Table 3)}}{\text{Overload factor (see Table 4)}} = \frac{2.33}{1.25} = 1.86kN$$

- (3) Comparison between the maximum thrust and the permissible power transmission capacity of the pinion  
 F<sub>max</sub><P<sub>max</sub>  
 Therefore, it is judged that the subject model number can be used.

Table3 Permissible Power transmission Capacity

Unit: kN

Model No.	Permissible Power transmission Capacity	Supported model
GP 6-20A	2.33	GSR 25-R
GP 6-20C	2.05	
GP 6-25A	2.73	
GP 6-25C	2.23	
GP 8-20A	3.58	GSR 30-R
GP 8-20C	3.15	
GP 8-25A	4.19	
GP 8-25C	3.42	
GP10-20A	5.19	GSR 35-R
GP10-20C	4.57	
GP10-25A	6.06	
GP10-25C	4.96	

Table4 Overload Factor

Impact from the prime mover	Impact from the driven machine		
	Uniform load	Medium impact	Large impact
Uniform load (electric motor, turbine, hydraulic motor, etc.)	1.0	1.25	1.75

<b>Tapped-hole LM Rail Type of Model CSR</b>	▶▶▶ B-157

## Structure and Features

Balls roll in four rows of raceways precision-ground on a LM rail and a LM block, and endplates incorporated in the LM block allow the balls to circulate. Since retainer plates hold the balls, they do not fall off even if the LM rail is pulled out.

This model is an integral type of LM Guide that squares an internal structure similar to model HSR, which has a proven track record and is highly reliable, with another and uses two LM rails in combination. It is machined with high precision so that the perpendicularity of the hexahedron of the LM block is within  $2\ \mu\text{m}$  per 100 mm in error. The two rails are also machined with high precision in relative straightness. As a result, extremely high accuracy in orthogonality is achieved. Since an orthogonal LM system can be achieved with model CSR alone, a conventionally required saddle is no longer necessary, the structure for X-Y motion can be simplified and the whole system can be downsized.

### [4-way Equal Load Type]

Each row of balls is placed at a contact angle of  $45^\circ$  so that the rated loads applied to the LM block are uniform in the four directions (radial, reverse radial and lateral directions), enabling the LM Guide to be used in all orientations.

### [High Rigidity]

Since balls are arranged in four rows in a well-balanced manner, this model is stiff against a moment, and smooth straight motion is ensured even a preload is applied to increase the rigidity.

The rigidity of the LM blocks is 50% higher than that of a combination of two HSR LM blocks secured together back-to-back with bolts. Thus, CSR is an optimal LM Guide for building an X-Y table that requires high rigidity.

## Types and Features

### Model CSR-S

This model is a standard type.

Specification Table⇒B-154

### Model CSR

It has a longer overall LM block length (L) and a greater rated load.

Specification Table⇒B-154

## Rated Loads in All Directions

Model CSR is capable of receiving loads in four directions: radial, reverse radial and lateral directions.

The basic load ratings are defined with an LM rail and two LM blocks, and uniform in the four directions (radial, reverse radial and lateral directions). Their actual values are provided in the specification table for CSR.

---

## Equivalent Load

---

When the LM block of model CSR receives loads in the reverse radial and lateral directions simultaneously, the equivalent load is obtained from the equation below.

$$P_E = P_R (P_L) + P_T$$

$P_E$  : Equivalent load (N)

: Radial direction

: Reverse radial direction

: Lateral direction

$P_R$  : Radial load (N)

$P_L$  : Reverse radial load (N)

$P_T$  : Lateral load (N)

---

## Structure and Features

---

Balls roll in two rows of raceways precision-ground on an LM rail and an LM block, and endplates incorporated in the LM block allow the balls to circulate. This model is an integral type of LM Guide that squares a unit of miniature LM Guide model RSR with another and uses two LM rails in combination. Since an orthogonal LM system with an extremely low height can be achieved with model MX alone, a conventionally required saddle is no longer necessary and the whole system can be downsized.

### [4-way Equal Load Type]

Each row of balls is placed at a contact angle of  $45^\circ$  so that the rated loads applied to the LM block are uniform in the four directions (radial, reverse radial and lateral directions), enabling the LM Guide to be used in all orientations.

### [Tapped-hole LM Rail Type]

There are two types of the LM rail: one designed to be mounted from the top with bolts, and a semi-standard type whose bottom face has tapped holes, allowing the rail to be mounted from the bottom.

## Types and Features

### Model MX

MX is divided into two types: RSR5M cross type and RSR7WM cross type.

Specification Table⇒B-160

## Rated Loads in All Directions

Model MX is capable of receiving loads in four directions: radial, reverse radial and lateral directions.

The basic load ratings are defined with an LM rail and an LM block, and uniform in the four directions (radial, reverse radial and lateral directions). Their actual values are provided in the specification table for MX.

Fig.1

## Equivalent Load

When the LM block of model MX receives loads in the radial, reverse radial and lateral directions simultaneously, the equivalent load is obtained from the equation below.

$$P_E = P_R (P_L) + P_T$$

$P_E$  : Equivalent load (N)

: Radial direction

: Reverse radial direction

: Lateral direction

$P_R$  : Radial load (N)

$P_L$  : Reverse radial load (N)

$P_T$  : Lateral load (N)

## Structure and Features

Balls roll in four rows of raceways precision-ground on an LM rail and an LM block, and endplates incorporated in the LM block allow the balls to circulate. Since retainer plates hold the balls, they do not fall off even if the LM rail is pulled out.

Model JR uses the same LM block as model HSR, which has a proven track record and is highly reliable. The LM rail has a sectional shape with high flexural rigidity, and therefore can be used as a structural member.

Unlike the conventional LM Guide type, whose LM rail was secured onto the base with bolts when installed, model JR's LM rail is integrated with the mounting base, and the top of the LM rail has the same structure as LM Guide model HSR. The lower part of the LM rail has a hardness of HRC25 or less, making it easy to cut the rail and enabling the rail to be welded.

When welding the rail, we recommend using welding rods compliant with JIS D 5816. (suggested manufacturer and model number: Kobelco LB-52).

### [4-way Equal Load Type]

Each row of balls is placed at a contact angle of 45° so that the rated loads applied to the LM block are uniform in the four directions (radial, reverse radial and lateral directions), enabling the LM Guide to be used in all orientations.

### [Can be Mounted Even Under Rough Conditions]

Since the central part of the LM rail is slightly thinner than the ends, even if the parallelism between two rails is poor the LM rail is capable of absorbing the error by bending inward or outward.

### [Sectional Shape with High Flexural Rigidity]

Since the LM rail has a sectional shape with high flexural rigidity, it can also be used as a structural member. In addition, even when the LM rail is partially fastened or supported in cantilever, the distortion is minimal.

Fig.1

## Structure and Features

---

Balls roll in four rows of raceways precision-ground on an LM rail and an LM block, and endplates incorporated in the LM block allow the balls to circulate.

With a structure that is basically the same as four-way equal load type LM Guide model HSR, which has a proven track record, this R Guide is a new concept product that allows highly accurate circular motion.

### [Freedom of Design]

Multiple LM blocks can individually move on the same rail. By arranging LM blocks on the load points, efficient structural design is achieved.

### [Shortened Assembly Time]

This model allows clearance-free, highly accurate circular motion as opposed to sliding guides or cam followers. You can easily assemble this model simply by mounting the LM rail and LM blocks with bolts.

### [Allows Circular Motion of 5m or Longer]

It allows circular motion of 5 m or longer, which is impossible with swivel bearings.

In addition, use of this model makes it easy to assemble, disassemble and reassemble equipment that circularly moves.

### [Capable of Receiving Loads in All Directions]

This model is capable of receiving loads in all directions since it has a structure that is basically the same as model HSR.

## Types and Features

### Model HCR

Specification Table⇒B-168

The flange of its LM block has tapped holes.

## Rated Loads in All Directions

Model HCR is capable of receiving loads in four directions: radial, reverse radial and lateral directions.

The basic load ratings are uniform in the four directions (radial, reverse radial and lateral directions), and their actual values are provided in the specification table for HCR.

## Equivalent Load

When the LM block of model HCR receives loads in all four directions simultaneously, the equivalent load is obtained from the equation below.

$$P_E = P_R (P_L) + P_T$$

$P_E$  : Equivalent load (N)

: Radial direction

: Reverse radial direction

: Lateral direction

$P_R$  : Radial load (N)

$P_L$  : Reverse radial load (N)

$P_T$  : Lateral load (N)

<b>Examples of Table Mechanisms</b>	▶▶▶ A-267
<b>Dimensional Drawing, Dimensional Table</b>	▶▶▶ B-172
<b>Jointed LM rail, example of model number coding</b>	▶▶▶ B-174

## Structure and Features

The Straight-Curved Guide HMG is a new straight-curved guide that allows the same type of LM blocks to continuously move on straight and curved rails by combining the technologies of the LM Guide HSR and the R Guide HCR. It achieves drastic cost reduction through improvement of work efficiency at the assembly and conveyance lines and the inspection equipment and simplification of the structure by eliminating a lift and a table.

### [Freedom of Design]

It allows free combinations of straight and curved shapes.

Since LM blocks can smoothly transit between the straight and curved sections, various combinations of straight and curved rails can be joined into various shapes such as O, U, L and S shapes. In addition, HMG allows a large table to be mounted and a heavy object to be carried through combinations of multiple blocks on a single rail or 2 or more LM rails. Thus, it provides great freedom of design.

Fig.1 Examples of Joining Rails into Different Shapes

**[Shortened Transportation Time]**

Unlike the shuttle method, using HMG units in a circulating system allows workpieces to be placed while other workpieces are being inspected or mounted, thus to significantly improve process time. Increasing the number of tables can further shorten process time.

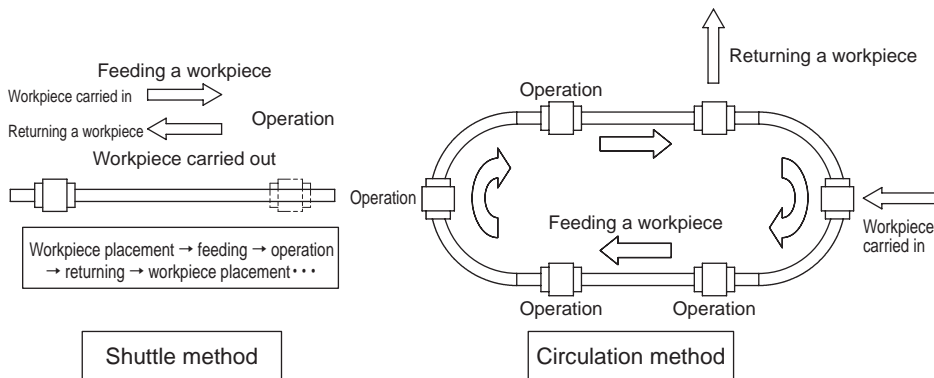

Fig.2 Improved process time

**[Cost Reduction through a Simplified Mechanism]**

Combination of straight and curved rails eliminates a lift and a turntable conventionally used for changing directions in the conveyance and production lines. Therefore, use of HMG simplifies the mechanism and eliminates a large number of parts, allowing the cost to be reduced. Additionally, man-hours in designing can also be reduced.

Fig.3

## Types and Features

### Model HMG

The flange of the LM block has tapped holes.  
Can be mounted from the top or the bottom.

Specification Table⇒B-172

LM Guide

### Rated Loads in All Directions

Model HMG is capable of receiving loads in all four directions: radial, reverse radial and lateral directions.

The basic load ratings are uniform in the four directions (radial, reverse radial and lateral directions), and their actual values are provided in the specification table for HMG.

### Equivalent Load

When the LM block of model HMG receives loads in all directions simultaneously, the equivalent load is obtained from the equation below.

$$P_E = P_R (P_L) + P_T$$

$P_E$  : Equivalent load (N)

: Radial direction

: Reverse radial direction

: Lateral direction

$P_R$  : Radial load (N)

$P_L$  : Reverse radial load (N)

$P_T$  : Lateral load (N)

---

## Accuracy Standards

---

For details, see A-121.

---

## Shoulder Height of the Mounting Base and the Corner Radius

---

For details, see A-328.

## Examples of Table Mechanisms

The Straight-Curved Guide HMG requires a rotating mechanism or a slide mechanism for the table to rotate the curved sections when 2 or more rails are used or when 2 or more LM blocks are connected on a single rail. Refer to Fig.5 for examples of such mechanisms.

Fig.5 Examples of Table Mechanisms

Fig.6 shows examples of designing a table when units are used on multiple axes. HMG requires a rotating mechanism and a slide mechanism since the table is decentered when an LM block transits from a straight section to a curved section. The amount of decentering differs according to the radius of the curved section and the LM block span. Therefore, it is necessary to design the system in accordance with the corresponding specifications.

Fig.7 shows detail drawings of the slide and rotating mechanisms. In the figure, LM Guides are used in the slide mechanism and Cross-Roller Rings in the rotating mechanism to achieve smooth sliding and rotating motions.

For driving the Straight-Curved Guide, belt drives and chain drives are available.

<b>Dimensional Drawing, Dimensional Table, Example of Model Number Coding</b>	▶▶▶ B-178
<b>Standard Length and Maximum Length of the LM Rail</b>	▶▶▶ B-180

## Structure and Features

Model NSR-TBC is the only LM Guide whose casing consists of two pieces instead of a single-piece LM block. The rigid, cast iron casing contains a cylindrical spline nut that is partially cut at an angle of 120°. This enables the model to self-aligning on the fitting surface with the casing, thus to permit rough installation.

### [Capable of Receiving Loads in All Directions]

NSR-TBC has four rows of balls. The balls are arranged in two rows on each shoulder of the LM rail, and can receive loads in all four directions: upward, downward and lateral directions. Due to the self-aligning structure, however, a rotational moment ( $M_c$ ) cannot be applied in a single-rail configuration.

### [Easy Installation and Accuracy Establishment]

Model NSR-TBC is highly capable of performing self-adjustment and self-alignment. As a result, even if two rails are not mounted with accuracy, the LM casing absorbs the error and it does not affect the traveling performance. Accordingly, the machine performance will not be deteriorated.

## Types and Features

### Model NSR-TBC

The flange of the LM casing has through holes, allowing the LM Guide to be mounted from the bottom.

[Specification Table⇒B-178](#)

## Rated Loads in All Directions

Model NSR-TBC is capable of receiving loads in four directions: radial, reverse radial and lateral directions.

The basic load ratings indicate the values in the radial direction in Fig.1, and their actual values are provided in the specification table for NSR-TBC. The values in the reverse radial and lateral directions are obtained from Table1 below.

Table1 Basic Load Ratings of Model NSR-TBC in All Directions

Direction	Basic dynamic load rating	Basic static load rating
Radial direction	C	C <sub>0</sub>
Reverse radial direction	C <sub>L</sub> =0.62C	C <sub>0L</sub> =0.50C <sub>0</sub>
Lateral directions	C <sub>T</sub> =0.56C	C <sub>0T</sub> =0.43C <sub>0</sub>

## Equivalent Load

When the LM casing of model NSR-TBC receives loads in the reverse radial and lateral directions simultaneously, the equivalent load is obtained from the equation below.

$$P_E = X \cdot P_L + Y \cdot P_T$$

P<sub>E</sub> : Equivalent load (N)  
 : Reverse radial direction  
 : Lateral direction

P<sub>L</sub> : Reverse radial load (N)

P<sub>T</sub> : Lateral load (N)

X, Y : Equivalent factor (see Table2)

Table2 Equivalent Factor of Model NSR-TBC

P <sub>E</sub>	X	Y
Equivalent load in reverse radial direction	1	1.155
Equivalent load in lateral direction	0.866	1

<b>Standard Length and Maximum Length of the LM Rail</b>	▶▶▶ B-190

## Features of Each Model

### High Temperature Type Model HSR-M1

---

## Structure and Features

---

Balls roll in four rows of raceways precision-ground on an LM rail and an LM block, and endplates incorporated in the LM block allow the balls to circulate.

Each row of balls is placed at a contact angle of 45° so that the rated loads applied to the LM block are uniform in the four directions (radial, reverse radial and lateral directions), enabling the LM Guide to be used in all orientations.

The high temperature type LM Guide is capable of being used at service temperature up to 150 °C thanks to THK's unique technologies in material, heat treatment and lubrication.

#### [Maximum Service Temperature: 150°C]

Use of stainless steel in the endplates and high temperature rubber in the end seals achieves the maximum service temperature of 150°C.

#### [Dimensional Stability]

Since it is dimensionally stabilized, it demonstrates superb dimensional stability after being heated or cooled (note that it shows linear expansion at high temperature).

#### [Highly Corrosion Resistant]

Since the LM block, LM rail and balls use stainless steel, which is highly corrosion resistant, this model is optimal for clean room applications.

#### [High Temperature Grease]

This model uses high temperature grease that shows little grease-based fluctuation in rolling resistance even if temperature changes from low to high levels.

**● Dimensional Stability Data**

Since this model has been treated for dimensional stability, its dimensional change after being cooled or heated is only minimal.

Note1) The above data on overall length and curvature indicate dimensional change when the LM rail is cooled to normal temperature after being heated at 150°C for 100 hours.

Note2) The samples consist of high temperature, standard and stainless steel types of model HSR25 + 580L.

**● Rolling Resistance Data in Relation to Grease**

Use a high temperature grease with which the rolling resistance of the LM system little fluctuates even temperature changes from a normal to high range.

For the measurements above, model HSR25M1R1C1 is used.

**● Thermal Characteristics of LM Rail and LM Block Materials**

Specific heat capacity: 0.481 J/(g·K)

Thermal conductivity: 20.67 W/(m·K)

Average coefficient of linear expansion: 11.8×10<sup>-6</sup>/°C

## Types and Features

### Model HSR-M1A

The flange of its LM block has tapped holes.

Specification Table⇒B-182

### Model HSR-M1LA

The LM block has the same cross-sectional shape as model HSR-M1A, but has a longer overall LM block length (L) and a greater rated load.

Specification Table⇒B-182

### Model HSR-M1B

The flange of the LM block has through holes. Used in places where the table cannot have through holes for mounting bolts.

Specification Table⇒B-184

### Model HSR-M1LB

The LM block has the same sectional shape as model HSR-M1B, but has a longer overall LM block length (L) and a greater rated load.

Specification Table⇒B-184

## Model HSR-M1R

With this type, the LM block has a smaller width (W) and tapped holes. Used in places where the space for table width is limited.

Specification Table⇒B-186

## Model HSR-M1LR

The LM block has the same sectional shape as model HSR-M1R, but has a longer overall LM block length (L) and a greater rated load.

Specification Table⇒B-186

## Model HSR-M1YR

When using two units of LM Guide facing each other, the previous model required much time in machining the table and had difficulty achieving the desired accuracy and adjusting the clearance. Since model HSR-M1YR has tapped holes on the side of the LM block, a simpler structure is gained and significant man-hour cutting and accuracy increase can be achieved.

Specification Table⇒B-188

Fig.1 Conventional Structure

Fig.2 Mounting Structure for Model HSR-M1YR

## Rated Loads in All Directions

Model HSR-M1 is capable of receiving loads in four directions: radial, reverse radial and lateral directions.

The basic load ratings are uniform in the four directions (radial, reverse radial and lateral directions), and their actual values are provided in the specification table for HSR-M1.

## Features of Each Model

### High Temperature Type Model RSR-M1

---

## Structure and Features

---

Balls roll in two rows of raceways precision-ground on an LM rail and an LM block, and endplates incorporated in the LM block allow the balls to circulate.

High temperature type miniature LM Guide model RSR-M1 is capable of being used at service temperature up to 150°C thanks to THK's unique technologies in material, heat treatment and lubrication.

#### [Maximum Service Temperature: 150°C]

Use of stainless steel in the endplates and high temperature rubber in the end seals achieves the maximum service temperature of 150°C.

#### [Dimensional Stability]

Since it is dimensionally stabilized, it demonstrates superb dimensional stability after being heated or cooled (note that it shows linear expansion at high temperature).

#### [Highly Corrosion Resistant]

Since the LM block, LM rail and balls use stainless steel, which is highly corrosion resistant, this model is optimal for clean room applications.

#### [High Temperature Grease]

This model uses high temperature grease that shows little grease-based fluctuation in rolling resistance even if temperature changes from low to high levels.

---

## Thermal Characteristics of LM Rail and LM Block Materials

---

- Specific heat capacity: 0.481 J/(g·K)
- Thermal conductivity: 20.67 W/(m·K)
- Average coefficient of linear expansion:  $11.8 \times 10^{-6}/^{\circ}\text{C}$

## Types and Features

### Models RSR-M1, RSR-M1K, M1V

Specification Table⇒B-198

This model is a standard type.

### Model RSR-M1N

Specification Table⇒B-198

It has a longer overall LM block length (L) and a greater rated load than standard types.

### Models RSR-M1W, M1WV

Specification Table⇒B-200

These models have greater overall LM block lengths (L), broader widths (W) and greater rated loads and permissible moments than standard types.

### Model RSR-M1WN

Specification Table⇒B-200

It has a longer overall LM block length (L), a greater rated load than standard types. Achieves the greatest load capacity among the high temperature type miniature LM Guide models.

## Rated Loads in All Directions

Model RSR-M1 is capable of receiving loads in four directions: radial, reverse radial and lateral directions.

The basic load ratings of models RSR9M1/M1W are uniform in the four directions (radial, reverse radial and lateral directions), and their actual values are provided in the specification table for RSR-M1.

The basic load ratings of models RSR12M1 to 20M1 indicate the values in the radial direction in Fig.1, and their actual values are provided in the specification table for RSR-M1. The values in the reverse radial and lateral directions are obtained from Table1 below.

Table1 Basic Load Ratings of Models RSR12M1 to 20M1 in All Directions

Direction	Basic dynamic load rating	Basic static load rating
Radial direction	C	C <sub>0</sub>
Reverse radial direction	C <sub>L</sub> =0.78C	C <sub>OL</sub> =0.70C <sub>0</sub>
Lateral directions	C <sub>T</sub> =0.78C	C <sub>OT</sub> =0.71C <sub>0</sub>

## Equivalent Load

When the LM block of models RSR9M1/M1W receives loads in all four directions simultaneously, the equivalent load is obtained from the equation below.

$$P_E = P_R (P_L) + P_T$$

P<sub>E</sub> : Equivalent load (N)  
 : Radial direction  
 : Reverse radial direction  
 : Lateral direction

P<sub>R</sub> : Radial load (N)

P<sub>L</sub> : Reverse radial load (N)

P<sub>T</sub> : Lateral load (N)

When the LM block of models RSR12M1 to 20M1 receives loads in the radial and lateral directions, or the reverse radial and lateral directions, simultaneously, the equivalent load is obtained from the equation below.

$$P_E = X \cdot P_R (P_L) + Y \cdot P_T$$

P<sub>E</sub> : Equivalent load (N)  
 : Radial direction  
 : Reverse radial direction  
 : Lateral direction

P<sub>R</sub> : Radial load (N)

P<sub>L</sub> : Reverse radial load (N)

P<sub>T</sub> : Lateral load (N)

X, Y : Equivalent factor  
 (see Table2 and Table3)

Table2 Equivalent Factor of Models RSR12M1 to 20M1 (when radial and lateral loads are applied)

P <sub>E</sub>	X	Y
Equivalent load in the radial direction	1	0.83
Equivalent load in lateral direction	1.2	1

Table3 Equivalent Factor of Models RSR12M1 to 20M1 (when reverse radial and lateral loads are applied)

P <sub>E</sub>	X	Y
Equivalent load in reverse radial direction	1	0.99
Equivalent load in lateral direction	1.01	1

## Features of Each Model

### High Corrosion Resistance Type Model HSR-M2

## Structure and Features

Balls roll in four rows of raceways precision-ground on an LM rail and an LM block, and endplates incorporated in the LM block allow the balls to circulate.

Each row of balls is placed at a contact angle of 45° so that the rated loads applied to the LM block are uniform in the four directions (radial, reverse radial and lateral directions), enabling the LM Guide to be used in all orientations.

The LM rail, LM block and balls are made of highly corrosion resistant stainless steel and the other metal parts are made of stainless steel, allowing superb corrosion resistance to be achieved. As a result, the need for surface treatment is eliminated.

## Structure and Features of the Caged Roller LM Guide

Fig.1 Structural Drawing of the Caged Roller LM Guide Model SRG

Caged Roller LM Guide is a roller guide that achieves low-friction, smooth motion and long-term maintenance-free operation by using a roller cage. In addition, to ensure ultra-high rigidity, rollers with low elastic deformation are used as the rolling elements and the roller diameter and the roller length are optimized.

Furthermore, the lines of rollers are placed at a contact angle of  $45^\circ$  so that the same rated load is applied in the four (radial, reverse and lateral) directions.

## Advantages of the Caged Roller Technology

- (1) Evenly spaced and aligned rollers circulate, preventing the rollers from skewing, minimizing rolling resistance fluctuations and achieving smooth and stable motion.
- (2) The absence of friction between rollers allows grease to be retained in grease pockets and achieves long-term maintenance-free operation.
- (3) The absence of friction between rollers achieves low heat generation and superbly high speed.
- (4) The absence of roller-to-roller collision ensures low noise and acceptable running sound.

## Structure and Features

---

SRN is an ultra-high rigidity Roller Guide that uses roller cages to allow low-friction, smooth motion and achieve long-term maintenance-free operation.

### [Ultra-high Rigidity]

A higher rigidity is achieved by using highly rigid rollers as the rolling elements and having the overall roller length more than 1.5 times greater than the roller diameter.

### [4-way Equal Load]

Since each row of rollers is arranged at a contact angle of 45° so that the LM block receives an equal load rating in all four directions (radial, reverse radial and lateral directions), high rigidity is ensured in all directions.

### [Smooth Motion through Skewing Prevention]

The roller cage allows rollers to form an evenly spaced line while circulating, thus preventing the rollers from skewing as the block enters an loaded area. As a result, fluctuation of the rolling resistance is minimized, and stable, smooth motion is achieved.

### [Long-term Maintenance-free Operation]

Use of roller cages eliminates friction between rollers and increases grease retention, enabling long-term maintenance-free operation to be achieved.

### [Global Standard Size]

SRG is designed to have dimensions almost the same as that of Full Ball LM Guide model HSR, which THK as a pioneer of the linear motion system has developed and is practically a global standard size.

## Types and Features

### Models SRG-15A, 20A

Specification Table⇒B-208

The flange of the LM block has tapped holes.  
Can be mounted from the top or the bottom.

### Model SRG-20L

## Error Allowance of the Mounting Surface

Caged Roller LM Guide model SRG is highly rigid since it uses rollers as its rolling elements, and the roller cage prevents the rollers from skewing. However, the mounting surface needs to be finished with high accuracy. If the error on the mounting surface is large, it will affect the rolling resistance and the service life. The following shows the maximum permissible value (limit value) according to the radial clearance.

Table1 Error Allowance in Parallelism (P) between Two Rails

Unit: mm

## Structure and Features

Based on Caged Roller LM Guide model SRG, this model has a wider rail and two rows of LM rail mounting holes to achieve high mounting strength and mounting stability. SRW is an ultra-high rigidity Roller Guide that uses roller cages to allow low-friction, smooth motion and achieve long-term maintenance-free operation.

### [Ultra-high Rigidity]

Since it has a wide rail and can be secured on the table using two rows of mounting bolts, the mounting strength is significantly increased. In addition, since the crosswise raceway distance (L) is large, model SRW is structurally strong against a moment load (Mc moment) in the rolling direction.

Furthermore, model SRW uses rollers that show little elastic deformation as its rolling elements, and the overall length of each roller is 1.5 times greater than the diameter, thus to increase the rigidity.

Fig.1 Result of Comparison between Models SRW and SRG in Moment Rigidity in the Rolling Direction (Mc Moment)

Fig.2 Comparison between Models SRW and SRG in Cross Section

### [Smoothness Achieved through Skewing Prevention]

The roller cage allows rollers to form an evenly spaced line while circulating, thus preventing the rollers from skewing as the block enters an loaded area. As a result, fluctuation of the rolling resistance is minimized, and stable, smooth motion is achieved.

### [Long-term Maintenance-free Operation]

Use of the roller cage eliminates friction between rollers and enables the lubricant to be retained in grease pockets formed between adjacent rollers. As the rollers circulate, the grease pocket serves to provide the required amount of lubricant to the contact curvature of the spacer and the roller, thus to achieve long-term maintenance-free operation.

Fig.3

## Types and Features

Ultra-high Rigidity Type (Wide) Model SRW

## Designing the Guide System

THK offers various types of LM Guides in order to meet diversified conditions. Supporting ordinary horizontal mount, vertical mount, inverted mount, slant mount, wall mount and single-axis mount, the wide array of LM Guide types makes it easy to achieve a linear guide system with a long service life and high rigidity while minimizing the required space for installation.

### Examples of Arrangements of the Guide System

The following are representative guide systems and arrangements when installing the LM Guide.  
(For indication of the reference surface, see A-338.)

Double-rail configuration when high rigidity is required in all directions

Double-rail configuration when high rigidity is required in the radial direction

When high rigidity is required in all directions and the installation space is limited in height

Single-rail configuration

When the minimum possible height of the equipment is allowed (Adjustable preload type)

When a medium load is applied and the mounting surface is rough (Preload, self-adjusting type)

Single-rail configuration

Triple-rail configuration

Double-rail configuration

4-rail configuration

LM Guide

## Method for Securing an LM Guide to Meet the Conditions

LM Guides are categorized into groups of types by mounting space and structure: a group of types to be mounted with bolts from the top, and another of types to be mounted from the bottom. LM rails are also divided into types secured with bolts and those secured with clamps (model JR). This wide array of types allows you to make a choice according to the application.

There are several ways of mounting the LM Guide as shown in Table1. When the machine is subject to vibrations that may cause the LM rail(s) or LM blocks to loosen, we recommend the securing method indicated by Fig.1 on A-323. (If 2 or more rails are used in parallel, only the LM block on the master rail should be secured in the crosswise direction.) If this method is not applicable for a structural reason, hammer in knock pins to secure the LM block(s) as shown in Table2 on A-323. When using knock pins, machine the top/bottom surfaces of the LM rail by 2 to 3 mm using a carbide end mill before drilling the holes since the surfaces are hardened.

Table1 Major Securing Methods on the Master-rail Side

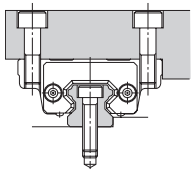

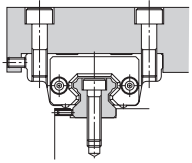

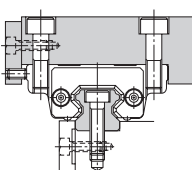

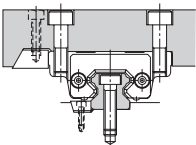

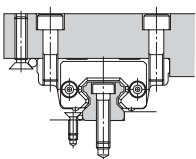

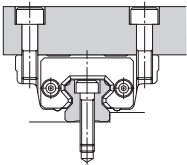

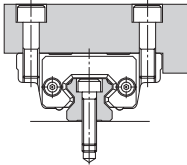

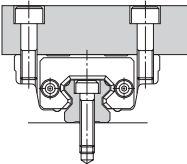

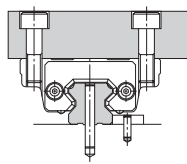

(a) Secured only with side reference surfaces	(b) Secured with set screws
	
(c) Secured with a presser plate	(d) Secured with tapered gibs
	
(e) Secured with pins	
	

Table2 Major Securing Methods on the Subsidiary-rail Side

(a) Secured only with the side reference surface of the rail	(b) Secured only with the side reference surface of the block
	
(c) Secured without a side reference surface	(d) Secured with dowel pins

# Designing a Mounting Surface

## Designing a Mounting Surface

If particularly high accuracy is required for the machine to which an LM Guide is to be mounted, it is necessary to mount the LM rail with high accuracy. To achieve the desired accuracy, be sure to design the mounting surface while taking the following points into account.

### [Corner Shape]

If the corner on the surface on which the LM rail or LM block is to be mounted is machined to be shaped R, which is greater than the chamfer dimension of the LM rail or LM block, then the rail or the block may not closely contact its reference surface. Therefore, when designing a mounting surface, it is important to carefully read the description on the "corner shape" of the subject model. (Fig.2)

Fig.2

### [Perpendicularity with the Reference Surface]

If the perpendicularity between the base mounting surface for the LM rail or the LM block and the reference surface is not accurate, the rail or the block may not closely contact the reference surface. Therefore, it is important to take into account an error of the perpendicularity between the mounting surface and the reference surface. (Fig.3)

Fig.3

## Point of Design

### Designing a Mounting Surface

#### [Dimensions of the Reference Surface]

When designing the reference surface, be sure to take into account the height and the thickness of the datum area. If the datum area is too high, it may interfere with the LM block. If it is too low, the LM rail or the LM block may not closely contact the reference-surface depending on the chamfer of the rail or the block. Additionally, if the datum area is too thin, the desired accuracy may not be obtained due to poor rigidity of the datum area when a lateral load is applied or when performing positioning using a lateral mounting bolt. (Fig.4)

Fig.4

#### [Dimensional Tolerance between the Reference Surface and the Mounting Hole]

If the dimensional tolerance between the reference surface of the LM rail or the LM block and the mounting hole is too large, the rail or the block may not closely contact the reference surface when mounted on the base.

Normally, the tolerance should be within  $\pm 0.1$  mm depending on the model. (Fig.5)

Fig.5

#### [Chamfer of the Tapped Mounting Hole]

To mount the LM rail, the mounting surface needs to be tapped and the tapped hole has to be chamfered. If the chamfer of the tapped hole is too large or too small, it may affect the accuracy. (Fig.6)

Guidelines for the chamfer dimension:

Chamfer diameter  $D$  = nominal diameter of the bolt + pitch

Example: Chamfer diameter  $D$  with M6 (pitch):

$$D = 6 + 1 = 7$$

Fig.6

## Shoulder Height of the Mounting Base and the Corner Radius

Normally, the mounting base for the LM rail and the LM block has a reference-surface on the side face of the shoulder of the base in order to allow easy installation and highly accurate positioning. The height of the datum shoulder varies with model numbers. See A-326 to A-332 for details. The corner of the mounting shoulder must be machined to have a recess, or machined to be smaller than the corner radius "r," to prevent interference with the chamfer of the LM rail or the LM block. The corner radius varies with model numbers. See A-326 to A-332 for details.

## Permissible Error of the Mounting Surface

The LM Guide allows smooth straight motion through its self-aligning capability even when there is a slight distortion or error on the mounting surface.

### [Error Allowance in the Parallelism between Two Rails]

The following tables show error allowances in parallelism between two rails that will not affect the service life in normal operation.

12 A	0.200/200
15 A	0.250/200
20 A	0.300/200

Note1) With the mounting surface, multiple accuracies are combined in many cases. Therefore, we recommend using 70% or less of the values above.

Note2) The above figures apply to normal clearances. When using two or more rails with clearance C1, we recommend using 50% or less of the values above.

**[Error Allowance in Vertical Level between Two Rails]**

The values in the tables on A-336 and A-337 represent error allowances in vertical level between two rails per axis-to-axis distance of 500 mm and are proportionate to axis-to-axis distances (200 mm for model RSR).

Fig.19 Error Allowance in Vertical Level (S) between Two Rails

## Marking on the Master LM Guide and Combined Use

### Marking on the Master LM Guide

All LM rails mounted on the same plane are marked with the same serial number. Of those LM rails, the one marked with "KB" after the serial number is the master LM rail. The LM block on the master LM rail has its reference surface finished to a designated accuracy, allowing it to serve as the positioning reference for the table. (See Fig.20.)

LM Guides of normal grade are not marked with "KB." Therefore, any one of the LM rails having the same serial number can be used as the master LM rail.

Master LM Guide

Subsidiary LM Guide

Fig.20 Master LM Guide and Subsidiary LM Guide

### Markings on the Reference Surface

In the LM Guide, the reference surface of the LM block is opposite the surface marked with the THK logo, and that of the LM rail is on the surface marked with a line (see Fig.21). If it is necessary to reverse the reference surface of the LM rail and block, or if the grease nipple must be oriented in the opposite direction, specify it.

Master LM Guide

Subsidiary LM Guide

Fig.21 Markings on the Reference Surface

**[Serial Number Marking and Combined Use of an LM Rail and LM Blocks]**

An LM rail and LM block(s) used in combination must have the same serial number. When removing an LM block from the LM rail and reinstalling the LM block, make sure that they have the same serial number and the numbers are oriented in the same direction. (Fig.22)

Fig.22 Serial Number Marking and Combined Use of an LM Rail and LM Blocks

**[Use of Jointed Rails]**

When a long LM rail is ordered, two or more rails will be jointed together to the desired length. When jointing rails, make sure that the joint match marks shown in Fig.23 are correctly positioned. When two LM Guides with connected rails are to be arranged in parallel to each other, the two LM Guides will be manufactured so that the two LM Guides are axisymmetrically aligned.

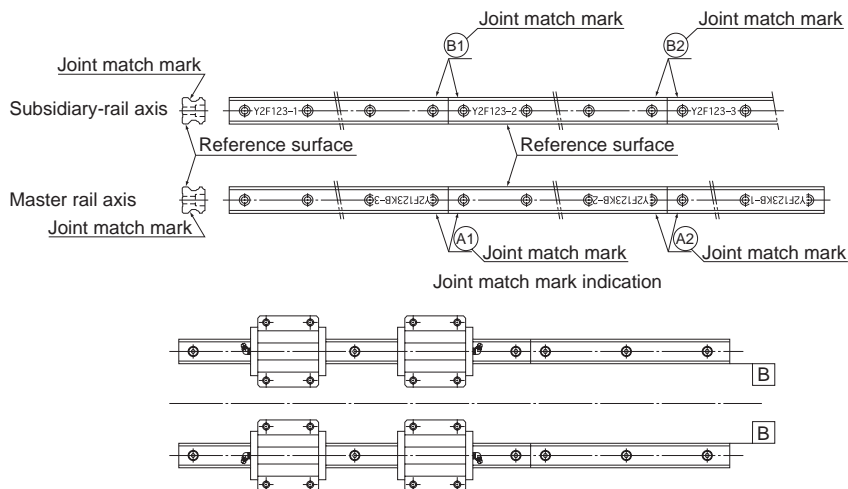

Fig.23 Use of Jointed Rails

# Mounting the LM Guide

## Mounting Procedure

[Example of Mounting the LM Guide When an Impact Load is Applied to the Machine and therefore Rigidity and High Accuracy are Required]

Fig.1 When an Impact Load is Applied to the Machine

### ● Mounting the LM Rail(s)

- (1) Be sure to remove burr, dent and dust from the mounting surface of the machine to which the LM Guide is to be mounted before installing the LM Guide. (Fig.2)

Note) Since the LM Guide is coated with anti-rust oil, remove it from the reference surface by wiping the surface with washing oil before using the guide. Once the anti-rust oil has been removed, the reference surface is prone to getting rusted. We recommend applying low-viscosity spindle oil.

Fig.2 Checking the Mounting Surface

- (2) Gently place the LM rail onto the base, and temporarily secure the bolts to the extent that the LM rail lightly contacts the mounting surface (align the line-marked side of the LM rail with the side reference-surface of the base). (Fig.3)

Note) The bolts for securing the LM Guide must be clean. When placing the bolts into the mounting holes of the LM rail, check if the bolt holes are displaced. (Fig.4) Forcibly tightening the bolt into a displaced hole may deteriorate the accuracy.

Fig.3 Aligning the LM Rail with the Reference-Surface

Fig.4 Checking with the Bolt for an Allowance

## Mounting Procedure and Maintenance

### Mounting the LM Guide

(3) Secure the set screws for the LM rail in order with a tightening force just enough to have the rail closely contact the side mounting surface. (Fig.5)

(4) Tighten the mounting bolts at the designated torque using a torque wrench. (See Fig.6, and Table1 and Table2 on A-350.)

Note) To achieve stable accuracy when tightening the LM rail mounting bolts, tighten them in order from the center to the rail ends.

(5) Mount the other rail in the same manner to complete the installation of the LM rails.

(6) Hammer in caps into the bolt holes on the top face of each LM rail until the top of the cap is on the same level as the top face of the rail.

Fig.5 Tightening the Set screws

Fig.6 Fully Fastening the Mounting Bolts

#### ● Mounting the LM Blocks

(1) Gently place the table on the LM blocks and temporarily fasten the mounting bolts.

(2) Press the master side LM blocks to the side reference surface of the table using set screws and position the table. (See Fig.1 on A-340.)

(3) Fully fasten the mounting bolts on the master side and the subsidiary side to complete the installation.

Note) To evenly secure the table, tighten the mounting bolts in diagonal order as shown in Fig.7.

Fig.7 Sequence of Tightening the LM Blocks

This method saves time in establishing straightness of the LM rail and eliminates the need to machine securing dowel pins, thus to drastically shorten the installation man-hours.

[Example of Mounting the LM Guide When the Master LM Rail is not Provided with Set screws]

Fig.8 When the Master LM Rail is not Provided with Set screws

● **Mounting the Master LM Rail**

After temporarily fastening the mounting bolts, firmly press the LM rail to the side reference surface at the position of each mounting bolt using a small vice and fully fasten the bolt. Perform this in order from either rail end to the other. (Fig.9)

Fig.9

● **Mounting the Subsidiary LM Rail**

To mount the subsidiary LM rail in parallel with the master LM rail, which has been correctly installed, we recommend adopting the methods below.

■ **Using a Straight-edge**

Place straight-edges between the two rails, and arrange the straight-edges in parallel with the side reference surface of the master LM rail using a dial gauge. Then, secure the mounting bolts in order while achieving straightness of the subsidiary rail with the straight edge as the reference by using the dial gauge. (Fig.10)

Fig.10

## Mounting Procedure and Maintenance

### Mounting the LM Guide

#### ■Using Parallelism of the Table

Secure the two LM blocks on the master LM rail with the table (or a temporary table for measurement), and temporarily fasten the LM rail and the LM block on the subsidiary LM rail with the table. Place a dial gauge to the side face of the LM block on the subsidiary rail from the dial stand fixed on the table top, then fasten the bolts in order while achieving parallelism of the subsidiary LM rail by moving the table from the rail end. (Fig.11)

Fig.11

#### ■Having the Subsidiary LM Rail Follow the Master LM Rail

Place the table on the blocks of the correctly mounted master LM rail and the temporarily fastened subsidiary LM rail, and fully fasten the two LM blocks on the master rail and one of the two LM blocks on the subsidiary rail with bolts. Fully tighten the mounting bolts on the subsidiary LM rail in order while temporarily fastening the remaining LM block on the subsidiary LM rail. (Fig.12)

Fig.12

#### ■Using a Jig

Use a jig like the one shown in Fig.13 to achieve parallelism of the reference surface on the subsidiary side against the side reference surface of the master side from one end of the rail by the mounting pitch, and at the same time, fully fasten the mounting bolts in order. (Fig.13)

Fig.13

[Example of Mounting the LM Guide When the Master LM Rail Does not Have a Reference Surface]

Fig.14

● **Mounting the Master LM Rail**

■ **Using a Temporary Reference Surface**

You can temporarily set a reference surface near the LM rail mounting position on the base to achieve straightness of the LM rail from the rail end. In this method, two LM blocks must be joined together and attached to a measurement plate, as shown in Fig.15.

Fig.15

■ **Using a Straight-edge**

After temporarily fastening the mounting bolts, use a dial gauge to check the straightness of the side reference surface of the LM rail from the rail end, and at the same time, fully fasten the mounting bolts.(Fig.16)

To mount the subsidiary LM rail, follow the procedure described on A-342.

Fig.16

## Mounting Procedure and Maintenance

### Mounting the LM Guide

#### [Procedure for Assembling Model HR]

The following procedure is recommended for assembling model HR.

- (1) Remove burr or knots from the LM rail mounting surface of the base using an oil-stone. (Fig.17)

Fig.17

- (2) Use a small vice to press the two LM rails to the base so that they closely contact the reference surface, then tighten the mounting bolts to the recommended torque (see A-350). (Fig.18)

- a. Check if any of the bolts has a sinking.
- b. Use a torque wrench to tighten the bolts in order from the center to both ends.

Fig.18

- (3) Mount the LM blocks on the table, then install them onto the LM rails. Be sure the mounting bolts for the LM blocks are temporarily fastened.

- (4) Tighten the clearance adjustment bolt alternately to adjust the clearance.

If a relatively large preload is applied in order to achieve high rigidity, control the tightening torque or the rolling resistance.

- a. It is preferable to use three clearance adjustment bolts for each LM block as shown in Fig.19.
- b. To obtain a favorable result of the clearance adjustment, set the tightening torque of the two outside screws at approx. 90% of that of the center screw.

Fig.19

- (5) Secure each LM block by gradually tightening the two LM block mounting bolts, which have temporarily been fastened, while sliding the table. (Fig.20)

Fig.20

### ● Example of Clearance Adjustment

Design the clearance adjustment bolt so that it presses the center of the side face of the LM block.

#### a. Using an adjustment screw

Normally, an adjustment screw is used to press the LM block.

#### b. Using tapered gibs

When high accuracy and high rigidity are required, use tapered gibs 1) and 2).

#### c. Using an eccentric pin

A type using an eccentric pin to adjust the clearance is also available.

## Mounting Procedure and Maintenance

### Mounting the LM Guide

#### [Procedure for Assembling Model GSR]

The procedure for assembling model GSR is as follows:

- (1) Align the table with the reference-surface of each LM block and fully fasten the mounting bolts to secure the blocks. Both ends of the table must have a datum surface. (Fig.21)
- (2) Place LM rail A onto the base and align the rail with a straight-edge. Fully fasten the mounting bolts using a torque wrench. (Fig.22)
- (3) Temporarily secure LM rail B onto the base, then mount the blocks on the rail by sliding the blocks. Temporarily fasten LM rail B while pressing it toward the LM blocks. (Fig.23)
- (4) Slide the table a few strokes to fit the LM blocks to LM rail B, then fully fasten LM rail B using a torque wrench. (Fig.24)

If there are more GSR units to be assembled, we recommend producing a jig like the one shown in Fig.25 first. You can easily mount LM rails while achieving parallelism of the LM rails using the jig.

Fig.21

Fig.22

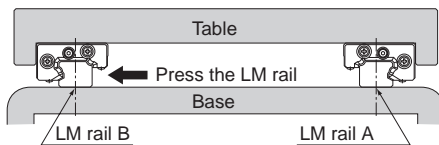

Fig.23

Fig.24

Fig.25

### [Procedure for Assembling Model JR]

#### ● Mounting the LM Rails

When two LM rails are to be used in parallel as shown in Fig.26, first secure one LM rail on the base, and place a dial gauge on the LM block. Then, place the pointer of the dial gauge on the side face and top face of the other LM rail to simultaneously adjust the parallelism and the level, thus to complete mounting the LM rails.

Fig.26

#### ● Jointing LM Rails

When two or more LM rails are to be jointed, a special metal fitting as shown in Fig.27 is available. For such applications, specify this fitting when ordering the LM Guide.

Fig.27

#### ● Welding the LM Rail

When welding the LM rail, it is best to weld the LM rail while clamping it at the welding point with a small vice or the like as shown in Fig.28. For effective welding, we recommend the following welding conditions. (During welding the LM rail, take care to prevent spatter from contacting the LM rail raceway.)

[Welding conditions]

Preheating temperature: 200°C

Postheating temperature: 350°C

Note) If the temperature exceeds 750°C, the LM rail may be hardened again.

[For shielded metal arc welding]

Welding rod: LB-52 (Kobelco)

[For carbon dioxide arc welding]

Wire: YGW12

Electric current: 200A

Fig.28

**Mounting Procedure and Maintenance****Mounting the LM Guide****[Procedure for Assembling Model HCR]**

To install the LM rails of R Guide model HCR, we recommend having any form of datum point (such as a pin) on the reference side (inside) of the LM rail, and pressing the LM rail to the datum point then stopping the LM rail with a presser plate from the counter-reference surface.

Fig.29 Method for Securing the LM Rails at the Joint

Fig.30 Method for Securing the LM Rail Using a Pin as a Datum Point

## Methods for Measuring Accuracy after Installation

### [When Measuring Running Accuracy for Single Rail Application]

When measuring running accuracy of the LM block, stable accuracy can be obtained by securing two LM blocks on an inspection plate, as shown in Fig.31. When using a dial gauge, we recommend placing the straight-edge as close as possible to the LM block in order to perform accurate measurement.

Fig.31 Methods for Measuring Accuracy after Installation

## Recommended Tightening Torque for LM Rails

With high-precision LM rails for the LM Guide, their raceways are ground and accuracy is inspected with the rails tightened with bolts. When mounting a high-precision LM rail on a machine, we recommend using the corresponding tightening torque indicated in Table1 or Table2

Table1 Tightening Torques when Pan Head Screws are Used  
Unit: N-cm

Screw model No.	Tightening torque	
	Not hardened	Hardened
M 2	17.6	21.6

LM Guide  
**Options**

# Seal and Metal Scraper

- For the supported models, see the table of options by model number on A-370.
- For the LM block dimension (dimension L) with seal attached, see B-224 to B-230.
- For the seal resistance, see A-372 to A-374.

Item name	Schematic diagram / mounting location	Purpose/location of use
End Seal	<p>End seal</p> <p>End seal</p>	Used in locations exposed to dust
Side Seal	<p>Side seal</p> <p>Side seal</p>	Used in locations where dust may enter the LM block from the side or bottom surface, such as vertical, horizontal and inverted mounts
Inner Seal	<p>Inner seal</p> <p>Inner seal</p>	Used in locations severely exposed to dust or cutting chips
Double Seals	<p>End seal</p> <p>Spacer</p> <p>End seal</p> <p>Hexagon socket button bolt</p>	Used in locations exposed to much dust or many cutting chips
Metal Scraper (Non-contact)	<p>End seal</p> <p>Metal scraper</p> <p>Hexagon socket button bolt</p> <p>Metal scraper</p>	Used in locations where welding spatter may adhere to the LM rail

Symbol	Contamination protection accessory
UU	End seal
SS	With end seal + side seal + inner seal
DD	With double seals + side seal + inner seal
ZZ	With end seal + side seal + inner seal + metal scraper
KK	With double seals + side seal + inner seal + metal scraper

# Laminated Contact Scraper LaCS

- For the supported models, see the table of options by model number on A-370.
- For the LM block dimension (dimension L) with LaCS attached, see B-224 to B-230.
- For the resistance of LaCS, see A-375.

For locations with adverse environment, Laminated Contact Scraper LaCS is available. LaCS removes minute foreign material adhering to the LM rail in multiple stages and prevents it from entering the LM block with laminated adhering structure (3-layer scraper).

Appearance Drawing

Structural Drawing

## [Features]

- Since the 3 layers of scrapers fully contact the LM rail, LaCS is highly capable of removing minute foreign material.
- Since it uses oil-impregnated, foam synthetic rubber with a self-lubricating function, low friction resistance is achieved.

Symbol	Contamination protection accessory
SSHH	With end seal + side seal + inner seal + LaCS
DDHH	With double seals + side seal + inner seal + LaCS
ZZHH	With end seal + side seal + inner seal + metal scraper + LaCS

# Light-Resistance Contact Seal LiCS

- For the supported models, see the table of options by model number on A-370.
- For the LM block dimension (dimension L) with LiCS attached, see B-233.
- For the resistance of LiCS, see A-376.

LiCS is a light sliding resistance contact seal. It is effective in removing dust on the raceway and retaining a lubricant such as grease. It achieves extremely low drag and smooth, stable motion.

Fig.1 Structural Drawing of SSR + LiCS

## [Features]

Light-Resistance Contact Seal LiCS is a seal that uses a light-resistance material in its sealing element and contacts the LM rail raceway to achieve low drag resistance. It is optimal for applications where low drag resistance is required, such as semiconductor-related devices, inspection devices and OA equipment all of which are used in favorable environments.

- Since the sealing element contacts the LM rail raceway, it is effective in removing dust on the raceway.
- Use of oil-impregnated, expanded synthetic rubber, which has excellent self-lubricating property, achieves low drag resistance.

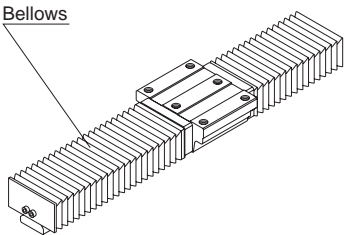

## Model number coding

- For the dedicated bellows dimensions, see B-235 to B-247.

Item name	Schematic diagram / mounting location	Purpose/location of use
<b>Dedicated Bellows</b>		Used in locations exposed to dust or cutting chips

## Dedicated LM Cover

- For the supported models, see the table of options by model number on A-370.
- For the dimensions of the dedicated LM cover, see B-248 to B-249.

Item name	Schematic diagram / mounting location	Purpose/location of use
<b>Dedicated LM Cover</b>		Used in locations exposed to dust or cutting chips Used in locations where high temperature foreign material such as flying spatter

# Cap C

If any of the LM rail mounting holes of an LM Guide is filled with cutting chips or foreign material, they may enter the LM block structure. Entrance of such foreign material can be prevented by covering each LM rail mounting hole with the dedicated cap.

Since the dedicated cap C for LM rail mounting holes uses a special synthetic resin with high oil resistance and high wear resistance, it is highly durable. Different sizes of the dedicated cap C are in stock as standard for hexagonal-socket-head type bolts of M3 to M22.

To attach the dedicated cap to the mounting hole, place a flat metal piece like one shown in Fig.1 on the cap and gradually hammer in the cap until it is on the same level as the top face of the LM rail. When attaching the dedicated cap C for LM rail mounting holes, do not remove any of the LM blocks from the LM rail.

Fig.1 Cap C

Note) The dedicated cap for the LM rail mounting hole can be made of other materials (e.g., metal). Contact THK for details.

# Plate Cover SV Steel Tape SP

●For the supported models, see the table of options by model number on A-370.

Item name	Schematic diagram / mounting location	Purpose/location of use
<p>Plate Cover SV</p>		<p>For the LM Guide, steel tapes are available as an essential means of contamination protection for machine tools. By covering the LM rail mounting holes with an ultra-thin stainless steel (SUS304) plate, the plate cover SV drastically increases sealability, thus to prevent the penetration of a coolant or cutting chips from the top face of the LM rail, which was previously impossible.</p> <p>For the mounting method, see A-359.</p> <p>Note) When mounting the plate cover, the LM rail needs to be machined. Indicate that the plate cover is required when ordering the LM Guide.</p>
<p>Steel Tape SP</p>		<p>For the LM Guide, steel tapes are available as an essential means of contamination protection for machine tools. By covering the LM rail mounting holes with an ultra-thin stainless steel (SUS304) plate, the plate cover SV drastically increases sealability, thus to prevent the penetration of a coolant or cutting chips from the top face of the LM rail, which was previously impossible. (When mounting the steel tape, end piece EP can be used as a means to secure the cover.)</p> <p>For the mounting method, see A-360.</p> <p>Note) When mounting the steel tape, the LM rail needs to be machined. Indicate that the steel tape is required when ordering the LM Guide.</p>

**[Mounting Procedure for Plate Cover SV]**

- (1) Attach slide pieces to the plate cover.

Place the slide pieces on the plate cover with their chamfered sides facing outward, hold the plate cover with the slide pieces and the securing plates, and then secure them with countersunk screws.

- (2) Use an LM block mounting/removing jig to remove the LM block from the LM rail, and then mount the fixing-jigs onto the LM rail. Identify the positions of the mounting holes on the fixing jigs, then secure the jigs with hexagonal-socket-head type bolts.

- (3) Temporarily secure either slide piece.

Insert either slide piece into one of the fixing-jigs, then attach the slide piece to the LM rail's end face using the tension adjustment bolt and gently secure the bolt until the bolt head is inside the fixing-jig.

- (4) Temporarily secure the other slide piece.

Temporarily secure the other slide piece in the same manner as above.

- (5) Apply tension to the plate cover.

Apply tension to the plate cover by evenly securing the tension adjustment bolts on both ends of the LM rail. Make sure there is only a small difference between the H and H' dimensions in Fig.5. If the difference is too large, there may be no interference left on either end.

- (6) Mount the LM block on the LM rail.

Identify the reference surface of the LM rail and the LM block, then insert the LM rail into the LM block using the LM block mounting /removing jig.

Note1) When removing or the mounting the LM block, use much care not to let the balls fall off.

Note2) The plate cover is an ultra-thin stainless steel (SUS304) plate. When handling it, use much care not to bend it.

Note3) The plate cover is available for models SNR/SNS35 to 65 and models NR/NRS35 to 100.

Fig.1

Fig.2

Fig.3

Fig.4

Fig.5

### [Mounting Procedure for Steel Tape SP]

- (1) Use an LM block mounting/removing jig to remove the LM block from the LM rail.
- (2) Thoroughly degrease and clean the top face of the LM rail, to which the steel tape is to be adhered. For degreasing, use an adequately volatile detergent (e.g., industrial alcohol).
- (3) Carefully adhere the steel tape from the end with care not to let it bend or sag, while gradually peeling the release paper from the steel tape.
- (4) Have the steel tape settle on the rail by rubbing the tape. The adhesive strength increases with time. The adhering tape can be peeled off by pulling its end upward.
- (5) Mount the LM block onto the LM rail using the LM block mounting/removing jig.
- (6) Attach the end pieces on both ends of the LM rail and further secure the steel tape. When securing the end pieces, fasten only the setscrew on the top face of each end piece.

(The tap on the end face of the end piece is used for mounting a bellows.)

Note1) The setscrew on the side face is used to lightly secure the bent steel tape. Be sure to stop fastening the screw as soon as it hits the end face, and do not force the screw further.

Note2) Since the steel tape is a thin steel plate, mishandling it may cause an accident such as cutting your finger. When handling it, take an effective safety measure such as wearing rubber gloves.

# QZ Lubricator

- For the supported models, see the table of options by model number on A-370.
- For the LM block dimension with QZ attached, see B-251 to B-253.

QZ Lubricator feeds the right amount of lubricant to the raceway on the LM rail. This allows an oil film to continuously be formed between the rolling element and the raceway, and drastically extends the lubrication and maintenance intervals.

The structure of QZ Lubricator consists of three major components: (1) a heavy oil-impregnated fiber net (function to store lubricant), (2) a high-density fiber net (function to apply lubricant to the raceway) and (3) an oil-control plate (function to adjust oil flow). The lubricant contained in QZ Lubricator is fed by the capillary phenomenon, which is used also in felt pens and many other products, as the fundamental principle.

## [Features]

- Since it supplements an oil loss, the lubrication maintenance interval can be significantly extended.
- Eco-friendly lubrication system that does not contaminate the surrounding area since it feeds the right amount of lubricant to the ball raceway.

Symbol	Contamination protection accessory
QZUU	With end seal + QZ
QZSS	With end seal + side seal + inner seal + QZ
QZDD	With double seals + side seal + inner seal + QZ
QZZZ	With end seal + side seal + inner seal + metal scraper + QZ
QZKK	With double seals + side seal + inner seal + metal scraper + QZ
QZGG	With LiCS + QZ
QZPP	With LiCS + side seal + inner seal + QZ
QZSSH	With end seal + side seal + inner seal + LaCS + QZ
QZDDH	With double seals + side seal + inner seal + LaCS + QZ
QZZZH	With end seal + side seal + inner seal + metal scraper + LaCS + QZ
QZKKH	With double seals + side seal + inner seal + metal scraper + LaCS + QZ

**● Significantly Extended Maintenance Interval**

Attaching QZ Lubricator helps extend the maintenance interval throughout the whole load range from the light load area to the heavy load area.

LM Guide Running Test without Replenishment of Lubricant

**● Effective Use of Lubricant**

Since the lubricator feeds the right amount of lubricant to the ball raceway, lubricant can be used efficiently.

[Test conditions] speed: 300 m/min

Amount of oil contained in QZ Lubricator  
 $0.166\text{cm}^3 / 2 \text{ units}$   
 (attached to both ends of the LM block)  
 $= 0.332\text{cm}^3$

Forced lubrication  
 $0.03\text{cm}^3 / 6\text{min} \times 16667\text{min}$   
 $= 83.3\text{cm}^3$

Lubricant consumption is 1/250 less than forced lubrication.

● **Effective in Helping Lubrication under Severe Environments**

A 5,000 km durability test was conducted under severe environments (containing coolant and contaminated environment).

[Test conditions]

Model No.	SNS45	HSR45
Load	8kN	6kN
Speed	60m/min	
Coolant	Immersed 48 hrs, dried 96 hrs	
Foreign material	Foundry dust (125 μm or less)	
Lubrication	AFA Grease + QZ	Super Multi 68 Oiling cycle: 0.1cc/shot Periodically lubricated every 16 min

[Test result]

\* When using the LM system under severe environment, use QZ Lubricator and Laminated Contact Scraper LaCS (see "Laminated Contact Scraper LaCS" on A-353) in combination.

# Lubrication Adapter

An oil lubricant-only lubrication adapter is available for models NR/NRS.

Even if the LM Guide is installed in an orientation where oil lubrication is difficult, such as wall mount and inversed mount, the adapter is capable of feeding a constant quantity of lubricant to the four raceways.

## [Features]

The dedicated lubrication adapter for models NR-NRS is built in with a constant quantity distributor. Therefore, the adapter can accurately feed a constant quantity of lubricant to each raceway regardless of the mounting orientation. The adapter is economical since it is capable of constantly feeding the optimum amount of lubricant and helping eliminate the supply of surplus lubricant.

To provide pipe arrangement, simply connect an intermittent lubrication pump widely used for ordinary machine tools to the greasing holes (M8) on the front and the side of the lubrication adapter.

Fig.1 Structural Drawing

## [Specifications]

Viscosity range of lubricant used	32 to 64 mm <sup>2</sup> /s recommended
Discharge	0.03×4, 0.06×4cc/1shot
Diameter of pipe connected	φ4, φ6
Material	Aluminum alloy

Fig.2

# Removing/mounting Jig

When assembling the guide, do not remove the LM block from the LM rail whenever possible. If it is inevitable to remove the LM block due to the plate cover type or the assembly procedure, be sure to use the removing/mounting jig.

Mounting the LM block without using the removing/mounting jig may cause rolling elements to fall from the LM block due to contamination by foreign material, damage to internal components or slight inclination. Mounting the LM block with some of the rolling elements missing may also cause damage to the LM block at an early stage.

When using the removing/mounting jig, do not incline the jig and match the ends of both LM rails.

If any of the rolling elements falls from the LM block, contact THK instead of using the product.

Note that the removing/mounting jig is not included in the LM Guide package as standard. When desiring to use it, contact THK.

# End Piece EP

For those models whose balls may fall if the LM rail is pulled out of the LM block, an end piece is attached to the product to prevent the LM block from being removed from the LM rail.

For models that can use the end piece, see the table below.

If removing the end piece when using the LM Guide, be sure that the LM block will not overshoot.

The end piece can also be used as a fixing jig for a steel tape, and is available also for the LM rail of models SSR, SR and HSR.

\*1. Model SHS: steel tape SP – applicable to models SHS15 to 65.

\*2. Model SSR: steel tape SP – not applicable to model SSR15; stainless steel type – not applicable to model SSR35.

\*3. Models SNR/SNS: plate cover SV – applicable to models SNR/SNS35 to 65;

steel tape SP – applicable to models SNR/SNS25 to 65.

\*4. Model SHW: inner seal and LaCS are not applicable to models SHW12, 14 and 17.

Models SHW12 and 14 cannot have a grease nipple; instead, a greasing hole is available.

stainless steel type – not applicable to some models (contact THK for details).

\*5. Model SRS: LaCS – applicable to models SRS20 and 25.

Models SRS9M, 9WM, 12M and 12WM cannot have a grease nipple; instead, a greasing hole is available.

\*6. Model HSR: SS – applicable to models HSR15 to 150; DD, ZZ and KK -- applicable to models HSR15 to 65;

LaCS -- applicable to models HSR15 to 35;

LL -- applicable to models HSR15 to 65;

steel tape SP: applicable to models HSR15 to 100; for models HSR8 to 12, only UU is applicable;

stainless steel type – not applicable to some models (contact THK for details).

for model Model HSR-R Grade Ct, only SS is applicable.

\*7. Model SR: DD, ZZ and KK – applicable to models SR15 to 70; LL -- applicable to models SR15 to 25;

steel tape SP: applicable to models SR20 to 70;

for models SR85 to 150, only UU and SS are applicable;

stainless steel type – not applicable to some models (contact THK for details).

SRW	70	32.8
	85	39.7
	100	58.3

Note1) Each resistance value in the table only consists of that of LaCS, and does not include sliding resistances of seals and other accessories.

Note2) For the maximum service speed of LaCS, contact THK.

## Maximum Seal Resistance of LiCS

Unit: N

Model No.		Resistance of LiCS
SSR	15X	1
	20X	1.1
	25X	1.6
	30X	1.6
	35X	2
SRG	15	0.7

Note) The value indicates the sliding resistance of two LiCS units per LM block and does not include the sliding resistances of the LM block and the side seals.

## Greasing Hole

### [Grease Nipple and Greasing Hole for Models SHW and SRS]

Models SHW and SRS do not have a grease nipple as standard. Installation of a grease nipple and the drilling of a greasing hole is performed at THK. When ordering SHW and SRS, indicate that the desired model requires a grease nipple or greasing hole. (For greasing hole dimensions and supported grease nipple types and dimensions, see Table1.)

When using SHW and SRS under harsh conditions, use QZ Lubricator\* (optional) or Laminated Contact Scraper LaCS\* (optional).

Note1) Grease nipple is not available for models SHW12, SHW14, SRS9M, SRS9WM, SRS12M and SRS12WM. They can have a greasing hole.

Note2) Using a greasing hole other than for greasing may cause damage.

Note3) For QZ Lubricator\*, see A-361. For Laminated Contact Scraper LaCS\*, see A-353.

Note4) When desiring a grease nipple for a model attached with QZ Lubricator, contact THK.

Table1 Table of Grease Nipple and Greasing Hole Dimensions

Unit: mm

Fig.1 Dimensions of the Grease Nipple for Model SHW

Fig.2 Dimensions of the Grease Nipple for Model SRS

Note) For the L dimension, see the corresponding specification table.

Model No.	E	Grease nipple or greasing hole
SHW	12	—
	14	—
	17	5
	21	5.5
	27	12
	35	12
	50	16
SRS	9M	—
	9WM	—
	12M	—
	12WM	—
	15M	4.0 (5.0)
	15WM	4.0 (5.0)
	20M	3.5 (5.0)
	25M	4.0 (5.5)

Note) Figures in the parentheses indicate dimensions without a seal.

**[Greasing Hole for Model SRG]**

Model SRG allows lubrication from both the side and top faces of the LM block. The greasing hole of standard types is not drilled through in order to prevent foreign material from entering the LM block. When using the greasing hole, contact THK.

When using the greasing hole on the top face of models SRG-R and SRG-LR, a greasing adapter is separately required. Contact THK for details.

Unit: mm

Model No.	Pilot hole for side nipple			Applicable nipple	Greasing hole on the top face			
	$e_0$	$f_0$	$D_0$		$D_2$ (O-ring)	$V$	$e_1$	
SRG	15A 15V	4	4	2.9	PB107	9.2 (P6)	0.5	5.5
	20A 20LA	4	5	2.9	PB107	9.2 (P6)	0.5	6.5
	20V 20LV	4	5	2.9	PB107	9.2 (P6)	0.5	6.5
	25C 25LC	6	6.3	5.2	M6F	10.2 (P7)	0.5	6
	25R 25LR	6	10.3	5.2	M6F	10.2 (P7)	4.5	6
	30C 30LC	6	5.8	5.2	M6F	10.2 (P7)	0.4	6
	30R 30LR	6	8.8	5.2	M6F	10.2 (P7)	3.4	6
	35C 35LC	6	6	5.2	M6F	10.2 (P7)	0.4	6
	35R 35LR	6	13	5.2	M6F	10.2 (P7)	7.4	6
	45C 45LC	7	7	5.2	M6F	10.2 (P7)	0.4	7
	45R 45LR	7	17	5.2	M6F	10.2 (P7)	10.4	7
	55C 55LC	9	8.5	5.2	M6F	10.2 (P7)	0.4	11
	55R 55LR	9	18.5	5.2	M6F	10.2 (P7)	10.4	11
	65LC	9	13.5	5.2	M6F	10.2 (P7)	0.4	10
	65LV	9	13.5	5.2	M6F	10.2 (P7)	0.4	10

Note) The greasing interval is longer than that of full-roller types because of the roller cage effect. However, the actual greasing interval may vary depending on the service environment, such as a high load and high speed. Contact THK for details.

**[Greasing Hole for Model SRN]**

Model SRN allows lubrication from both the side and top faces of the LM block. The greasing hole of standard types is not drilled through in order to prevent foreign material from entering the LM block. When using the greasing hole, contact THK.

Unit: mm

Model No.	Pilot hole for side nipple			Applicable nipple	Greasing hole on the top face				
	$e_0$	$f_0$	$D_0$		$D_2$	(O-ring)	$V$	$e_1$	
SRN	35C	8	6.5	5.2	M6F	10.2	(P7)	0.4	6
	35LC	8	6.5	5.2	M6F	10.2	(P7)	0.4	6
	35R	8	6.5	5.2	M6F	10.2	(P7)	0.4	6
	35LR	8	6.5	5.2	M6F	10.2	(P7)	0.4	6
	45C	8.5	7	5.2	M6F	10.2	(P7)	0.4	7
	45LC	8.5	7	5.2	M6F	10.2	(P7)	0.4	7
	45R	8.5	7	5.2	M6F	10.2	(P7)	0.4	7
	45LR	8.5	7	5.2	M6F	10.2	(P7)	0.4	7
55C	10	8	5.2	M6F	10.2	(P7)	0.4	11	
55LC	10	8	5.2	M6F	10.2	(P7)	0.4	11	
55R	10	8	5.2	M6F	10.2	(P7)	0.4	11	
55LR	10	8	5.2	M6F	10.2	(P7)	0.4	11	
65LC	9	11	5.2	M6F	10.2	(P7)	0.4	10	
65LR	9	11	5.2	M6F	10.2	(P7)	0.4	10	

Note) The greasing interval is longer than that of full-roller types because of the roller cage effect. However, the actual greasing interval may vary depending on the service environment, such as a high load and high speed. Contact THK for details.

**[Greasing Hole for Model SRW]**

Model SRW allows lubrication from both the side and top faces of the LM block. The greasing hole of standard types is not drilled through in order to prevent foreign material from entering the LM block. When using the greasing hole, contact THK.

Unit: mm

Model No.	Pilot hole for side nipple			Applicable nipple	Greasing hole on the top face			
	e <sub>0</sub>	f <sub>0</sub>	D <sub>0</sub>		D <sub>2</sub>	(O-ring)	V	e <sub>1</sub>
SRW	7	17	5.2	M6F	13	(P10)	0.4	33.7
	85	9	17.7	M6F	13	(P10)	0.4	42.75
	100	9	22.4	M6F	13	(P10)	0.4	55

Note) The greasing interval is longer than that of full-roller types because of the roller cage effect. However, the actual greasing interval may vary depending on the service environment, such as a high load and high speed. Contact THK for details.

**[Semi-standard Greasing Hole for Model HSR]**

For model HSR, a semi-standard greasing hole is available. Specify the appropriate model number according to the application.

Type with a Greasing Hole Drilled on the Side Surface

Type with a Greasing Hole Drilled on the Top Face

**[Lubrication for Model HR]**

The LM block has a greasing hole in the center of its top face. To provide lubrication through this hole, the table must be machined to also have a greasing hole as shown in Fig.3 and attach a grease nipple or the like. When using oil lubrication, it is necessary to identify the lubrication route. Contact THK for details.

Fig.3 Example of Machining a Greasing Hole

## Precautions on Using the LM Guide

### [Handling]

- (1) Disassembling components may cause dust to enter the system or degrade mounting accuracy of parts. Do not disassemble the product.
- (2) Tilting an LM block or LM rail may cause them to fall by their own weight.
- (3) Dropping or hitting the LM Guide may damage it. Giving an impact to the product could also cause damage to its function even if the product looks intact.

### [Lubrication]

- (1) Thoroughly remove anti-rust oil and feed lubricant before using the product.
- (2) Do not mix lubricants of different physical properties.
- (3) In locations exposed to constant vibrations or in special environments such as clean rooms, vacuum and low/high temperature, normal lubricants may not be used. Contact THK for details.
- (4) When planning to use a special lubricant, contact THK before using it.
- (5) When adopting oil lubrication, the lubricant may not be distributed throughout the LM system depending on the mounting orientation of the system. Contact THK for details.
- (6) Lubrication interval varies according to the conditions. Contact THK for details.

### [Precautions on Use]

- (1) Entrance of foreign material may cause damage to the ball (roller) circulating path or functional loss. Prevent foreign material, such as dust or cutting chips, from entering the system.
- (2) When planning to use the LM system in an environment where the coolant penetrates the LM block, it may cause trouble to product functions depending on the type of the coolant. Contact THK for details.
- (3) Contact THK if you desire to use the product at a temperature of 80°C or higher.
- (4) If foreign material such as dust or cutting chips adheres to the product, replenish the lubricant after cleaning the product with pure white kerosene. For available types of detergent, contact THK.
- (5) When using the LM Guide with inverted mount, breakage of the endplate due to an accident or the like may cause balls (rollers) to fall and the LM block to come off from the LM rail and fall. In these cases, take preventive measures such as adding a safety mechanism for preventing such falls.
- (6) When using the product in locations exposed to constant vibrations or in special environments such as clean rooms, vacuum and low/high temperature, contact THK in advance.
- (7) When removing the LM block from the LM rail and then replacing the block, an LM block mounting/removing jig that facilitates such installation is available. Contact THK for details.

### [Storage]

When storing the LM Guide, enclose it in a package designated by THK and store it in a horizontal orientation while avoiding high temperature, low temperature and high humidity.

## Precautions on Using Options for the LM Guide

---

### QZ Lubricator

---

#### [Handling]

Dropping or hitting the product may damage it. Use much care when handling it. Do not block the vent hole with grease or the like.

#### [Service Environment]

Be sure the service temperature of this product is between  $-10$  to  $+50^{\circ}\text{C}$ , and do not clean the product by immersing it in an organic solvent or white kerosene, or leave it unpacked. When using it out of the service temperature range, contact THK in advance.

#### [Use in a Special Environment]

When desiring to use the product in a special environment, contact THK.

#### [Precaution on Selection]

Secure a stroke longer than the overall LM block with QZ Lubricator attached.

#### [Corrosion Prevention]

QZ is a lubricating device designed to feed a minimum amount of oil to the raceway, and does not provide an anti-rust effect to the whole LM Guide. When using it in an environment subject to a coolant or the like, we strongly recommend applying grease to the mounting base of the LM Guide and to the rail ends as an anti-rust measure.

## Laminated Contact Scraper LaCS, Side Scraper

---

#### [Service Environment]

Be sure the service temperature of this product is between  $-20$  to  $+80^{\circ}\text{C}$ , and do not clean the product by immersing it in an organic solvent or white kerosene, or leave it unpacked.

#### [Impregnating Oil]

The lubricant impregnated into the scraper is used to increase its sliding capability. For lubrication of the LM Guide, attach QZ Lubricator, or the grease nipple on the side face of the end plate of the LM block, before providing a lubricant.

#### [Function]

It is specifically designed to provide dust prevention capability to remove foreign material and liquid. To seal oil, an end seal is required.

#### [Design]

When using the product, be sure to attach the rail cap C or the plate cover.

**Precautions on Use**

## Precautions on Using Options for the LM Guide

---

**Light Sliding Resistance Contact Seal LiCS**

---

**[Service Environment]**

Be sure the service temperature of this product is between -20 to +80°C, and do not clean the product by immersing it in an organic solvent or white kerosene, or leave it unpacked.

It contacts only with the LM rail raceway. Do not use it in harsh environments.

**[Impregnating Oil]**

The lubricant impregnated into LiCS is used to increase its sliding capability. For lubrication of the LM Guide, attach the grease nipple on the end plate of the LM block before providing a lubricant.

# LM Guide Actuator

## Model KR

LM Guide + Ball Screw = Integral-structure Actuator

Fig.1 Structure of LM Guide Actuator Model KR

## Structure and Features

Because of its integral-structure nut block consisting of a highly rigid LM rail with a U-shaped cross section, LM Guide units on both side faces and a Ball Screw unit in the center, LM Guide Actuator model KR achieves a highly rigid and highly accurate actuator in a minimal space.

In addition, since the housings A and B also serve as support units and the nut block as a table, this model allows significant reduction of man-hours and time required for the design and assembly since it incorporates a support unit and a table, thus to contribute to total cost cutting.

**Features of Each Model**  
**LM Guide Actuator Model KR**

**[4-way Equal Load]**

Each train of balls is arranged at a contact angle of 45° so that the rated load on the nut block is uniform in the four directions (radial, reverse radial and lateral directions). As a result, model KR can be used in any mounting orientation.

Fig.2 Load Capacity and Contact Angle of Model KR

**[High Rigidity]**

Unlike the conventional LM Guide, model KR uses an outer rail structure to achieve higher rigidity against an overhung load.

The LM rail has a wide U-shaped cross section to reduce the weight and minimize deflection.

Fig.3 Cross Section of the LM Rail

Table1 Cross-sectional Characteristics of the LM Rail

Unit: mm<sup>4</sup>

Model No.	$I_x$	$I_y$	Mass (kg/100mm)
KR15	$9.08 \times 10^3$	$1.42 \times 10^4$	0.104
KR20	$6.1 \times 10^3$	$6.2 \times 10^4$	0.26
KR26	$1.7 \times 10^4$	$1.5 \times 10^5$	0.39
KR30H	$2.7 \times 10^4$	$2.8 \times 10^5$	0.5
KR33	$6.2 \times 10^4$	$3.8 \times 10^5$	0.66
KR45H	$8.4 \times 10^4$	$8.9 \times 10^5$	0.9
KR46	$2.4 \times 10^5$	$1.5 \times 10^6$	1.26
KR55	$2.2 \times 10^5$	$2.3 \times 10^6$	1.5
KR65	$4.6 \times 10^5$	$5.9 \times 10^6$	2.31

$I_x$ =geometrical moment of inertia around X axis  
 $I_y$ =geometrical moment of inertia around Y axis

**[High Accuracy]**

Since the linear guide section consists of 4 rows of circular-arc grooves that enable balls to smoothly move even under a preload, a highly rigid guide with no clearance is achieved. Additionally, variation in frictional resistance caused by load fluctuation is minimized, allowing the system to follow highly accurate feed.

Fig.4 Contact Structure of Model KR

**[Space Saving]**

Use of a nut block integrating LM Guide units on both ends and a Ball Screw unit in the center makes model KR a highly rigid and highly accurate actuator in a minimal space.

Fig.5 Cross Sectional Drawing

Fig.6 Cross Sectional Drawing

**[Seal]**

Model KR is equipped with end seals and side seals for dust prevention as standard.

Table2 shows the rolling resistance and seal resistance per nut block (guide section).

Table2 Maximum Resistance Value Unit: N

Model No.	Rolling resistance value	Seal resistance value	Total
KR15	0.2	0.7	0.9
KR20	0.5	0.7	1.2
KR26	0.6	0.8	1.4
KR30H	1.5	2.0	3.5
KR33	1.5	1.9	3.4
KR45H	2.5	2.6	5.1
KR46	2.5	2.5	5
KR55	5.0	3.8	8.8
KR65	6.0	4.1	10.1

Note) The rolling resistance represents the value when a lubricant is not used.

---

## Types and Features

---

### Model KR-A (with a Single Long Nut Block)

Representative model of KR.

Model KR-A

---

### Model KR-B (with Two Long Nut Blocks)

Equipped with two units of the nut block of model KR-A, this model achieves higher rigidity, higher load capacity and higher accuracy.

Model KR-B

---

### Model KR-C (with a Single Short Nut Block)

This model has a shorter overall length of the nut block and a longer stroke than model KR-A. (Supported models: model KR30H, 33, 45H, 46)

Model KR-C

---

### Model KR-D (with Two Short Nut Blocks)

Equipped with two units of the nut block of model KR-C, this design allows a span between blocks that suits the equipment, thus to achieve high rigidity.

(Supported models: model KR30H, 33, 45H, 46)

Model KR-D

## Load Ratings in All Directions and Static Permissible Moment

### [Load Rating]

#### ● LM Guide Unit

Model KR is capable of receiving loads in four directions: radial, reverse radial and lateral directions. Its basic load ratings are equal in all four directions (radial, reverse radial and lateral directions), and their values are indicated in Table3 on A-392 and A-393.

#### ● Ball Screw Unit

Since the nut block is incorporated with a Ball Screw, model KR is capable of receiving an axial load. The basic load rating value is indicated in Table3 on A-392 and A-393.

#### ● Bearing Unit (Fixed Side)

Since housing A contains an angular bearing, model KR is capable of receiving an axial load. The basic load rating value is indicated in Table3 on A-392 and A-393.

### [Equivalent Load (LM Guide Unit)]

The equivalent load when the LM Guide unit of model KR simultaneously receives loads in all directions is obtained from the following equation.

$$P_E = P_R (P_L) + P_T$$

$P_E$	: Equivalent load	(N)
	: Radial direction	
	: Reverse radial direction	
	: Lateral direction	
$P_R$	: Radial load	(N)
$P_L$	: Reverse radial load	(N)
$P_T$	: Lateral load	(N)

**[Static Permissible Moment (LM Guide Unit)]**

The LM Guide unit of model KR is capable of receiving moments in four directions only with a single nut block.

Table 4 on A-395 shows static permissible moments in the  $M_A$ ,  $M_B$  and  $M_C$  directions.

With a single long nut block (type A)

With double long nut blocks (type B)

With a single short nut block (type C)

With double short nut blocks (type D)

## Features of Each Model

### LM Guide Actuator Model KR

Table4 Static Permissible Moments of Model KR

Unit: N·m

KR65-A	1300	1300	3920
KR65-B	7230	7230	7840

Note1) Symbols A, B, C or D in the end of each model number indicates the nut block size and the number of nut blocks used.

A: With a single long nut block

B: With double long nut blocks

C: With a single short nut block

D: With double short nut blocks

Note2) The values for models KR - B/D indicate the values when double nut blocks are used in close contact with each other.

## Maximum Travel Speed and the Maximum Length

The maximum travel speed of model KR is limited by the dangerous speed of the ball screw shaft and the DN value regardless of the maximum rotation speed of the motor. These factors must be taken into account especially when model KR operates at high speed.

The maximum lengths are indicated in terms of LM rail length.

Table5 Maximum Travel Speed and the Maximum Length

Model No.	Ball Screw lead (mm)	LM rail length (mm)	Maximum travel speed (mm/s)						Maximum length(mm)

KR45H	THK AFB-LF Grease	A-M6F
KR46	THK AFB-LF Grease	A-M6F
KR55	THK AFB-LF Grease	A-M6F
KR65	THK AFB-LF Grease	A-M6F

## Service Life

Model KR consists of an LM Guide, a Ball Screw and a support bearing. The nominal life of each component can be obtained using the basic dynamic load rating indicated in Table3 on A-392 and A-393 (Rated Load of Model KR).

### [LM Guide Unit]

#### ● Nominal Life

$$L = \left( \frac{f_c \cdot C}{f_w \cdot P_c} \right)^3 \times 50$$

- L : Nominal life (km)  
 (The total travel distance that 90% of a group of identical LM Guide units independently operating under the same conditions can achieve without showing flaking)
- C : Basic dynamic load rating (N)
- P<sub>c</sub> : Calculated applied load (N)
- f<sub>w</sub> : Load factor (see Table8 on A-401)
- f<sub>c</sub> : Contact factor (see Table7 on A-401)

- If a moment is applied to model KR-A/C or model KR-B/D using two nut blocks in close contact with each other, calculate the equivalent load by multiplying the applied moment by the equivalent factor indicated in Table9 on A-401.

$$P_m = K \cdot M$$

- P<sub>m</sub> : Equivalent load (per nut block) (N)
- K : Equivalent moment factor(see Table9 on A-401)
- M : Applied moment (N-mm)  
 (If planning to use three or more nut blocks, or use nut blocks with a wide span, contact THK.)

- If moment M<sub>c</sub> is applied to model KR-B/D

$$P_m = \frac{K_c \cdot M_c}{2}$$

- If a radial load (P) and a moment are simultaneously applied to model KR

$$P_E = P_m + P$$

- P<sub>E</sub> : Total equivalent radial load (N)  
 Perform a nominal life calculation using the above data.

### ● Service Life Time

When the nominal life (L) has been obtained, if the stroke length and the number of reciprocations are constant, the service life time is obtained using the equation below.

$$L_h = \frac{L \times 10^6}{2 \cdot l_s \cdot n_1 \times 60}$$

- $L_h$  : Service life time (h)  
 $l_s$  : Stroke length (mm)  
 $n_1$  : Number of reciprocations per minute ( $\text{min}^{-1}$ )

### [Ball Screw Unit/Bearing Unit(Fixed Side)]

#### ● Nominal Life

$$L = \left( \frac{C_a}{f_w \cdot F_a} \right)^3 \times 10^6$$

- $L$  : Nominal life (rev)  
 (The total number of revolutions that 90% of a group of identical Ball Screw units independently operating under the same conditions can achieve without showing flaking)  
 $C_a$  : Basic dynamic load rating (N)  
 $F_a$  : Applied axial load (N)  
 $f_w$  : Load factor (see Table8 on A-401)

When the nominal life has been obtained from the equation above, if the stroke length and the number of reciprocations per minute are constant, the service life time is obtained using the following equation.

#### ● Service Life Time

$$L_h = \frac{L \cdot l}{2 \cdot l_s \cdot n_1 \times 60}$$

- $L_h$  : Service life time (h)  
 $l_s$  : Stroke length (mm)  
 $n_1$  : Number of reciprocations per minute ( $\text{min}^{-1}$ )  
 $l$  : Ball Screw lead (mm)

## Features of Each Model

## LM Guide Actuator Model KR

■**f<sub>c</sub>: Contact Factor**

If two nut blocks are used in close contact with each other with model KR-B/D, multiply the basic load rating by the corresponding contact factor indicated in Table7.

Table7 Contact Factor (f<sub>c</sub>)

Block type	Contact factor f <sub>c</sub>
A, C type	1
B, D type	0.81

■**f<sub>w</sub>: Load Factor**

Table8 shows load factors.

Table8 Load Factor (f<sub>w</sub>)

Vibrations/ impact	Speed(V)	f <sub>w</sub>
Faint	Very low $V \leq 0.25\text{m/s}$	1 to 1.2
Weak	Slow $0.25 < V \leq 1\text{m/s}$	1.2 to 1.5
Medium	Medium $1 < V \leq 2\text{m/s}$	1.5 to 2
Strong	High $V > 2\text{m/s}$	2 to 3.5

■**K: Moment Equivalent Factor (LM Guide Unit)**

When model KR travels under a moment, the distribution of load applied to the LM Guide is locally large (see A-75). In such cases, calculate the load by multiplying the moment value by the corresponding moment equivalent factor indicated in Table9.

Symbols K<sub>A</sub>, K<sub>B</sub> and K<sub>C</sub> indicate the moment equivalent loads in the M<sub>A</sub>, M<sub>B</sub> and M<sub>C</sub> directions, respectively.

Table9 Equivalent moment factor(K)

Model No.	K <sub>A</sub>	K <sub>B</sub>	K <sub>C</sub>

KR30H-B	$2.76 \times 10^{-2}$	$2.76 \times 10^{-2}$	$4.78 \times 10^{-2}$
KR30H-C	$2.77 \times 10^{-1}$	$2.77 \times 10^{-1}$	$4.78 \times 10^{-2}$
KR30H-D	$3.99 \times 10^{-2}$	$3.99 \times 10^{-2}$	$4.78 \times 10^{-2}$
KR33-A	$1.51 \times 10^{-1}$	$1.51 \times 10^{-1}$	$4.93 \times 10^{-2}$
KR33-B	$2.57 \times 10^{-2}$	$2.57 \times 10^{-2}$	$4.93 \times 10^{-2}$
KR33-C	$2.77 \times 10^{-1}$	$2.77 \times 10^{-1}$	$4.93 \times 10^{-2}$
KR33-D	$3.55 \times 10^{-2}$	$3.55 \times 10^{-2}$	$4.93 \times 10^{-2}$
KR45H-A	$9.83 \times 10^{-2}$	$9.83 \times 10^{-2}$	$3.45 \times 10^{-2}$
KR45H-B	$1.87 \times 10^{-2}$	$1.87 \times 10^{-2}$	$3.45 \times 10^{-2}$
KR45H-C	$1.83 \times 10^{-1}$	$1.83 \times 10^{-1}$	$3.45 \times 10^{-2}$
KR45H-D	$2.81 \times 10^{-2}$	$2.81 \times 10^{-2}$	$3.45 \times 10^{-2}$
KR46-A	$1.01 \times 10^{-1}$	$1.01 \times 10^{-1}$	$3.38 \times 10^{-2}$
KR46-B	$1.78 \times 10^{-2}$	$1.78 \times 10^{-2}$	$3.38 \times 10^{-2}$
KR46-C	$1.85 \times 10^{-1}$	$1.85 \times 10^{-1}$	$3.38 \times 10^{-2}$
KR46-D	$2.5 \times 10^{-2}$	$2.5 \times 10^{-2}$	$3.38 \times 10^{-2}$
KR55-A	$8.63 \times 10^{-2}$	$8.63 \times 10^{-2}$	$2.83 \times 10^{-2}$
KR55-B	$1.53 \times 10^{-2}$	$1.53 \times 10^{-2}$	$2.83 \times 10^{-2}$
KR65-A	$7.55 \times 10^{-2}$	$7.55 \times 10^{-2}$	$2.14 \times 10^{-2}$
KR65-B	$1.35 \times 10^{-2}$	$1.35 \times 10^{-2}$	$2.14 \times 10^{-2}$

Note) The values for models KR-B/D indicate the values when double nut blocks are used in close contact with each other.

## Static Safety Factor

### [Calculating the Static Safety Factor]

#### ● LM Guide Unit

To calculate a load applied to the LM Guide of model KR, the average load required for calculating the service life and the maximum load needed for calculating the static safety factor must be obtained first. In particular, if the system starts and stops frequently, or if a large moment caused by an overhung load is applied to the system, it may receive an unexpectedly large load.

When selecting a model number, make sure that the desired model is capable of receiving the required maximum load (whether stationary or in motion).

$$f_s = \frac{C_0}{P_{\max}}$$

$f_s$  : Static safety factor

$C_0$  : Basic static load rating (N)

$P_{\max}$  : Maximum applied load (N)

\* The basic static load rating is a static load with a constant direction and magnitude whereby the sum of the permanent deformation of the rolling element and that of the raceway on the contact area under the maximum stress is 0.0001 times the rolling element diameter.

#### ● Ball Screw Unit/Bearing Unit(Fixed Side)

If an unexpected external force is applied in the axial direction as a result of an inertia caused by an impact or start and stop while model KR is stationary or operating, it is necessary to take into account the static safety factor.

$$f_s = \frac{C_{0a}}{F_{\max}}$$

$f_s$  : Static safety factor

$C_{0a}$  : Basic static load rating (N)

$F_{\max}$  : Maximum applied load (N)

### [Standard Values for the Static Safety Factor ( $f_s$ )]

Machine using the LM system	Load conditions	Lower limit of $f_s$
General industrial machinery	Without vibration or impact	1 to 1.3
	With vibration or impact	2 to 3

\* The standard value of the static safety factor may vary according to the conditions such as environment, lubrication status, mounting section accuracy or rigidity.

## Example of Calculating the Nominal Life

### [Condition (Horizontal Installation)]

Assumed model number	: KR 5520A

### [Consideration]

#### ● Studying the LM Guide Unit

##### ■ Load Applied to the Nut Block

\* Assuming that a single nut block is used, convert applied moments  $M_A$  and  $M_B$  into applied load by multiplying them by the moment equivalent factor ( $K_A=K_B=8.63 \times 10^{-2}$ ).

\* Assuming that a single shaft is used, convert applied moment  $M_C$  into applied load by multiplying it by the moment equivalent factor ( $K_C=2.83 \times 10^{-2}$ ).

- During uniform motion:

$$P_1 = mg + K_C \cdot mg \times 40 = 627 \text{ N}$$

- During acceleration:

$$P_{1a} = P_1 + K_A \cdot m\alpha \times 193 = 1826 \text{ N}$$

$$P_{1aT} = -K_B \cdot m\alpha \times 40 = -249 \text{ N}$$

- During deceleration:

$$P_{1d} = P_1 - K_A \cdot m\alpha \times 193 = -572 \text{ N}$$

$$P_{1dT} = K_B \cdot m\alpha \times 40 = 249 \text{ N}$$

\* Since the groove under a load is different from the assumed groove, give "0" (zero) to  $P_{1aT}$  and  $P_{1d}$ .

#### ■ Combined Radial And Thrust Load

- During uniform motion:

$$P_{1E} = P_1 = 627 \text{ N}$$

- During acceleration:

$$P_{1aE} = P_{1a} + P_{1aT} = 1826 \text{ N}$$

- During deceleration:

$$P_{1dE} = P_{1d} + P_{1dT} = 249 \text{ N}$$

#### ■ Static Safety Factor

$$f_s = \frac{C_0}{P_{\max}} = \frac{C_0}{P_{1aE}} = 33.9$$

#### ■ Nominal Life

- Average load

$$P_m = \sqrt[3]{\frac{1}{l_s} (P_{1E}^3 \times 1095 + P_{1aE}^3 \times 52.5 + P_{1dE}^3 \times 52.5)} = 790 \text{ N}$$

- Nominal life

$$L = \left( \frac{C}{f_w \cdot P_m} \right)^3 \times 50 = 3.25 \times 10^6 \text{ km}$$

$f_w$  : Load factor

(1.2)

## ● Studying the Ball Screw Unit

### ■ Axial load

- During forward uniform motion:

$$Fa_1 = \mu \cdot mg + f = 11 \text{ N}$$

$\mu$  : Friction coefficient(0.005)

$f$  : Rolling resistance of one KR block + seal resistance(10.0 N)

- During forward acceleration:

$$Fa_2 = Fa_1 + m\alpha = 83 \text{ N}$$

- During forward deceleration:

$$Fa_3 = Fa_1 - m\alpha = -61 \text{ N}$$

- During uniform backward motion

$$Fa_4 = -Fa_1 = -11 \text{ N}$$

- During backward acceleration:

$$Fa_5 = Fa_4 - m\alpha = -83 \text{ N}$$

- During backward deceleration:

$$Fa_6 = Fa_4 + m\alpha = 61 \text{ N}$$

\* Since the groove under a load is different from the assumed groove, give "0" (zero) to  $Fa_3$ ,  $Fa_4$  and  $Fa_5$ .

### ■ Static Safety Factor

$$f_s = \frac{C_{0a}}{F_{amax}} = \frac{C_{0a}}{Fa_2} = 111.9$$

### ■ Buckling Load

$$P_1 = \frac{n \cdot \pi^2 \cdot E \cdot I}{l_a^2} \times 0.5 = 11000 \text{ N}$$

$P_1$  : Buckling load (N)

$l_a$  : Distance between two mounting surfaces (1300 mm)

$E$  : Young's modulus ( $2.06 \times 10^5 \text{ N/mm}^2$ )

$n$  : Factor for mounting method (fixed-fixed: 4.0, see A-694)

0.5 : Safety factor

$I$  : Minimum geometrical moment of inertia of the shaft ( $\text{mm}^4$ )

$$I = \frac{\pi}{64} \cdot d_1^4$$

$d_1$  : Screw-shaft thread minor diameter (17.5 mm)

### ■ Permissible tensile Compressive Load

$$P_2 = \delta \cdot \frac{\pi}{4} \cdot d_1^2 = 35300 \text{ N}$$

$P_2$  : Permissible tensile compressive load (N)

$\delta$  : Permissible tensile compressive stress (147 N/mm<sup>2</sup>)

$d_1$  : Screw-shaft thread minor diameter (17.5mm)

### ■ Dangerous Speed

$$N_1 = \frac{60 \cdot \lambda^2}{2\pi \cdot \ell_b^2} \cdot \sqrt{\frac{E \times 10^3 \cdot I}{\gamma \cdot A}} \times 0.8 = 1560 \text{ min}^{-1}$$

$N_1$  : Dangerous speed (min<sup>-1</sup>)

$\ell_b$  : Distance between two mounting surfaces (1300mm)

$\gamma$  : Density (7.85 × 10<sup>-6</sup>kg/mm<sup>3</sup>)

$\lambda$  : Factor according to the mounting method (fixed-supported 3.927, see A-696)

0.8 : Safety factor

### ■ DN Value

$$DN=31125(\leq 50000)$$

$D$  : Ball center-to-center diameter (20.75mm)

$N$  : Maximum working rotation speed (1500min<sup>-1</sup>)

### ■ Nominal Life

- Average axial load

$$F_{am} = \sqrt[3]{\frac{1}{2 \cdot \ell_s} (F_{a1}^3 \times 1095 + F_{a2}^3 \times 52.5 + F_{a6}^3 \times 52.5)} = 26.2 \text{ N}$$

- Nominal life

$$L = \left( \frac{C_a}{f_w \cdot F_{am}} \right)^3 \cdot \ell = 3.05 \times 10^7 \text{ km}$$

$f_w$  : Load factor (1.2)

$\ell$  : Ball Screw lead (20mm)

### ● Bearing Unit (Fixed Side)

#### ■ Axial Load (Same as the Ball Screw Unit)

$$F_{a1} = 11 \text{ N}$$

$$F_{a2} = 83 \text{ N}$$

$$F_{a3} = 0 \text{ N}$$

$$F_{a4} = 0 \text{ N}$$

$$F_{a5} = 0 \text{ N}$$

$$F_{a6} = 61 \text{ N}$$

#### ■ Static Safety Factor

$$f_s = \frac{P_{0a}}{F_{amax}} = \frac{P_{0a}}{F_{a2}} = 48.0$$

#### ■ Nominal Life

##### ● Average axial load

$$F_{am} = \sqrt[3]{\frac{1}{2 \cdot l_s} (F_{a1}^3 \times 1095 + F_{a2}^3 \times 52.5 + F_{a6}^3 \times 52.5)} = 26.2 \text{ N}$$

##### ● Nominal life

$$L = \left( \frac{C_a}{f_w \cdot F_{am}} \right)^3 \times 10^6 = 1.41 \times 10^{13} \text{ rev}$$

$$f_w \quad : \text{ Load factor} \quad (1.2)$$

\* Convert the above nominal life into the service life in travel distance of the Ball Screw.

$$L_s = L \cdot l \times 10^{-6} = 2.82 \times 10^8 \text{ km}$$

#### [Result]

The table below shows the result of the examination.

KR5520A	LM guide unit	Ball screw unit	Bearing unit (Fixed side)
Static safety factor	33.9	111.9	48.0
Buckling load(N)	—	11000	—
Permissible tensile compressive load(N)	—	35300	—
Dangerous speed(min <sup>-1</sup> )	—	1560	—
DN Value	—	31125	—
Nominal life(km)	3.25 × 10 <sup>6</sup>	3.05 × 10 <sup>7</sup>	2.82 × 10 <sup>8</sup>
Maximum axial load(N)	—	76	—
Maximum working rotation speed(min <sup>-1</sup> )	—	1500	—

Note1) From the static safety coefficient and other values above, it is judged that the assumed model can be used.

Note2) Of the rated lives of the three components, the shortest value (of LM Guide unit) is considered the nominal life of the assumed model KR 5520A.

##### ■ Load Applied to the Block

\* Assuming that a single block is used, convert applied moments  $M_A$  and  $M_B$  into applied load by multiplying them by the moment equivalent factor ( $K_A=K_B=8.63 \times 10^{-2}$ ).

#### ● During uniform motion:

$$P_1 = K_A \cdot mg \times 193 = 4900 \text{ N}$$

$$P_{1T} = K_B \cdot mg \times 40 = 1016 \text{ N}$$

#### ● During acceleration:

$$P_{1a} = P_1 + K_A \cdot m\alpha \times 193 = 6100 \text{ N}$$

$$P_{1aT} = P_{1T} + K_B \cdot m\alpha \times 40 = 1264 \text{ N}$$

#### ● During deceleration:

$$P_{1d} = P_1 - K_A \cdot m\alpha \times 193 = 3701 \text{ N}$$

$$P_{1dT} = P_{1T} - K_B \cdot m\alpha \times 40 = 767 \text{ N}$$

##### ■ Combined Radial And Thrust Load

#### ● During uniform motion:

$$P_{1E} = P_1 + P_{1T} = 5916 \text{ N}$$

#### ● During acceleration:

$$P_{1aE} = P_{1a} + P_{1aT} = 7364 \text{ N}$$

#### ● During deceleration:

$$P_{1dE} = P_{1d} + P_{1dT} = 4468 \text{ N}$$

##### ■ Static Safety Factor

$$f_s = \frac{C_0}{P_{\max}} = \frac{C_0}{P_{1aE}} = 8.4$$

##### ■ Nominal Life

#### ● Average load

$$P_m = \sqrt[3]{\frac{1}{\ell_s} (P_{1E}^3 \times 1095 + P_{1aE}^3 \times 52.5 + P_{1dE}^3 \times 52.5)} = 5947 \text{ N}$$

#### ● Nominal life

$$L = \left( \frac{C}{f_w \cdot P_m} \right)^3 \times 50 = 7.61 \times 10^3 \text{ km}$$

$$f_w \quad : \text{ Load factor} \quad (1.2)$$

## ● Studying the Ball Screw Unit

### ■ Axial Load

- During upward uniform motion:

$$F_{a1} = mg + \mu \cdot mg + f = 306 \text{ N}$$

$\mu$  : Friction coefficient (0.005)       $f$  : Sliding resistance per block (10.0 N)

- During upward acceleration:

$$F_{a2} = F_{a1} + m\alpha = 378 \text{ N}$$

- During upward deceleration:

$$F_{a3} = F_{a1} - m\alpha = 234 \text{ N}$$

- During downward uniform motion:

$$F_{a4} = mg - \mu \cdot mg - f = 283 \text{ N}$$

- During downward acceleration:

$$F_{a5} = F_{a4} - m\alpha = 211 \text{ N}$$

- During downward deceleration:

$$F_{a6} = F_{a4} + m\alpha = 355 \text{ N}$$

### ■ Static Safety Factor

$$f_s = \frac{C_{0a}}{F_{\max}} = \frac{C_{0a}}{F_{a2}} = 24.5$$

$$F_m = \sqrt[3]{\frac{1}{2 \cdot l_s} (F_{a1}^3 \times 1095 + F_{a2}^3 \times 525 + F_{a3}^3 \times 525 + F_{a4}^3 \times 1095 + F_{a5}^3 \times 525 + F_{a6}^3 \times 525)} = 296 \text{ N}$$

#### ● Nominal life

$$L = \left( \frac{C_a}{f_w \cdot F_m} \right)^3 \times 10^6 = 9.80 \times 10^9 \text{ rev}$$

$$f_w : \text{Load factor} \quad (1.2)$$

\* Convert the above nominal life into the service life in travel distance of the Ball Screw.

$$L_s = L \cdot l \times 10^{-6} = 1.96 \times 10^5 \text{ km}$$

### [Result]

The table below shows the result of the examination.

KR5520A	LM guide unit	Ball screw unit	Bearing unit (Fixed side)
Static safety factor	8.4	24.5	10.5
Buckling load(N)	—	11000	—
Permissible tensile compressive load(N)	—	35300	—
Dangerous speed(min <sup>-1</sup> )	—	1560	—
DN Value	—	31125	—
Nominal life(km)	7.61 × 10 <sup>5</sup>	2.12 × 10 <sup>4</sup>	1.96 × 10 <sup>5</sup>
Maximum axial load(N)	—	76	—
Maximum working rotation speed(min <sup>-1</sup> )	—	1500	—

Note1) From the static safety coefficient and other values above, it is judged that the assumed model can be used.

Note2) Of the rated lives of the three components, the shortest value (of LM Guide unit) is considered the nominal life of the assumed model KR 5520A.

## Accuracy Standards

The accuracy of model KR is defined in positioning repeatability, positioning accuracy, backlash and running parallelism.

### [Positioning Repeatability]

After repeating positioning to a given point in the same direction seven times, measure the halting point and obtain the value of half the maximum difference. Perform this measurement in the center and both ends of the travel distance, use the maximum value as the measurement value and express the value of half the maximum difference with symbol "±" as positioning repeatability.

Fig.9 Positioning Repeatability

### [Positioning Accuracy]

Using the maximum stroke as the reference length, express the maximum error between the actual distance traveled from the reference point and the command value in an absolute value as positioning accuracy.

Fig.10 Positioning Accuracy

### [Running of Parallelism]

Place a straightedge on the surface table where model KR is mounted, measure almost throughout the travel distance of the nut block using a test indicator. Use the maximum difference among the readings within the travel distance as the running parallelism measurement.

Fig.11 Running of Parallelism

### [Backlash]

Feed and slightly move the nut block and read the measurement on the test indicator as the reference value. Subsequently, apply a load to the nut block from the same direction (table feed direction), and then release the nut block from the load. Use the difference between the reference value and the return as the backlash measurement.

Fig.12 Backlash

Perform this measurement in the center and near both ends, and use the maximum value as the measurement value.

## Features of Each Model

## LM Guide Actuator Model KR

The accuracies of model KR are classified into normal grade (no symbol), high accuracy grade (H) and precision grade (P). Tables below show standards for all the accuracies.

Table10 Normal Grade (No Symbol)

Unit: mm

Model No.	Rail length	Positioning Repeatability	Positioning Accuracy	Running of parallelism	Backlash	Starting torque (N·cm)
KR20	100	±0.01	No standard defined	No standard defined	0.02	0.5
	150

Note3) The starting torque represents the value when THK AFB-LF Grease is used.

However, that of models KR20 and KR26 represents the value when THK AFA Grease is used, and that of KR15 represents the value when THK AFF Grease is used.

Note4) If highly viscous grease such as vacuum grease and clean room grease is used, the actual starting torque may exceed the corresponding value in the table. Use much care in selecting a motor.

Note5) For accuracy with a rail length longer than the standard rail length, contact THK.

# Caged Ball LM Guide Actuator

Model SKR

Fig.1 Structure of Caged Ball LM Guide Model SKR

## Structure and Features

Caged Ball LM Guide Actuator model SKR is a compact actuator that has a nut block consisting of LM blocks and a ball screw nut integrated inside a U-shaped LM rail.

In addition, this model achieves high speed operation, lower noise and longer-term maintenance-free operation by using ball cages in the LM Guide units and the Ball Screw unit.

### [4-way Equal Load]

Each train of balls is arranged at a contact angle of  $45^\circ$  so that the rated load on the nut block is uniform in the four directions (radial, reverse radial and lateral directions). As a result, model SKR can be used in any mounting orientation.

Fig.2 Load Capacity and Contact Angle of Model SKR

**Features of Each Model**

**Caged Ball LM Guide Actuator Model SKR**

**[High Rigidity]**

Use of an LM rail with a U-shaped cross section increases the rigidity against a moment and torsion.

Fig.3 Cross Section of the LM Rail

**[High Accuracy]**

Since the linear guide section consists of 4 rows of circular-arc grooves that enable balls to smoothly move even under a preload, a highly rigid guide with no clearance is achieved. Additionally, variation in frictional resistance caused by load fluctuation is minimized, allowing the system to follow highly accurate feed.

Table1 Cross-sectional Characteristics of the LM Rail

Unit: mm<sup>4</sup>

Model No.	$I_x$	$I_y$	Mass (kg/100mm)
SKR33	$5.35 \times 10^4$	$3.52 \times 10^6$	0.61
SKR46	$2.05 \times 10^5$	$1.45 \times 10^6$	1.26

$I_y$ =geometrical moment of inertia around Y axis

Fig.4 Contact Structure of SKR

**[Space Saving]**

Due to an integral structure where LM Guide units are placed on both side faces of the nut block and a Ball Screw unit is placed in the center of the nut block, a highly rigid and highly accurate actuator with a minimal space is achieved.

Fig.5 Cross Sectional Drawing

LM Guide Actuator

**[High Speed]**

Model SKR supports a latest high-rotation servomotor (6,000 min<sup>-1</sup>) using a ball cage and is capable of operating at higher speed than the conventional model KR.

In addition, a new type with a 20 -mm lead is added to lineups of the new model SKR33 in order to achieve fast feed (formerly, only 6 mm and 10 mm ball screw leads were available for the conventional model KR33).

Table2 Maximum Travel Speed

Model No.	Ball Screw lead (mm)	LM rail length (mm)	Maximum travel speed (mm/s)		Maximum length(mm)
			Long block	Short block	
SKR33	6	150	600		700
		200	600		
		300	600

		940	845	784	

The maximum travel speed of model SKR is limited by the dangerous speed of the ball screw shaft despite the maximum rotation speed of the motor (6,000 min<sup>-1</sup>). Take much care when using the product at high speed.

When considering the use of this model at speed higher than the maximum speed indicated above, contact THK.

## Caged Ball/Roller Technology

### [High Lubricity]

Model SKR uses ball cages to eliminate friction between balls and significantly improve torque characteristics. As a result, the torque fluctuation is reduced and superb lubricity is achieved.

Item	Description
Shaft diameter/lead	$\phi 13/10\text{mm}$
Shaft rotation speed	$60\text{min}^{-1}$

Fig.6 Comparison of Torque Fluctuation between Model SKR and Model KR

### [Low Noise, Acceptable Running Sound]

Model SKR uses ball cages in the LM Guide unit and the Ball Screw unit. As a result, low noise and acceptable running sound are achieved.

Fig.7 Comparison of Noise between Model SKR4610A and Model KR4610A

**[Long-term Maintenance-free Operation]**

With model SKR, the ball cage effect helps increase grease retention and achieve long-term maintenance-free operation.

**[Long Service Life – 3 Times Longer (with Model \*KR3310. Calculated from the Following Equation)]**

With model SKR, both the LM Guide unit and the Ball Screw unit have larger basic dynamic load ratings, and therefore a longer service life is achieved.

The rated service life is calculated from the following equation.

LM guide unit

$$L=(C/P)^3 \times 50$$

L : Nominal life (km)

C : Basic dynamic load rating (N)

P : Applied load (N)

Ball screw unit

$$L=(Ca/Fa)^3 \times 10^6$$

L : Nominal life (rev)

Ca : Basic dynamic load rating (N)

Fa : Applied axial load (N)

As indicated in the equation above, the greater the basic dynamic load rating, the longer the service life of both the LM Guide unit and the Ball Screw unit.

Table3 Comparison of Basic Dynamic Load Rating between Model SKR and Model KR

Unit: N

Basic dynamic load rating		SKR3310	KR3310	SKR4620	KR4620
LM guide unit	Long type block	17000	11600	39500	27400
	Short type block	11300	4900	28400	14000
Ball screw unit		2700	1760	4240	3040

**[Seal]**

Model SKR is equipped with end seals and side seals for contamination protection as standard.

Table4 shows the rolling resistance and seal resistance per nut block (guide section).

Table4 Maximum Resistance Value Unit: N

Model No.	Rolling resistance value	Seal resistance value	Total
SKR33	3.0	1.4	4.4
SKR46	2.5	1.8	4.3

Note) The rolling resistance represents the value when a lubricant is not used.

---

## Types and Features

---

### Model SKR-A

Representative model of SKR.

Model SKR-A

### Model SKR-B

Equipped with two units of the nut block of model SKR-A, this model achieves higher rigidity, higher load capacity and higher accuracy.

Model SKR-B

### Model SKR-C

This model has a shorter overall length of the block and a longer stroke than model SKR-A.

\* With model SKR3320, a short-block type is not available.

Model SKR-C

### Model SKR-D

Equipped with two units of the nut block of model SKR-C, this design allows a span between blocks that suits the equipment, thus to achieve high rigidity.

\* With model SKR3320, a short-block type is not available.

Model SKR-D

## Load Ratings in All Directions and Permissible Moment

### [Load Rating]

Caged Ball LM Guide Actuator Model SKR consists of an LM Guide, a Ball Screw and a support bearing.

#### ● LM Guide Unit

Model SKR is capable of receiving loads in four directions: radial, reverse radial and lateral directions. Its basic load ratings are equal in all four directions (radial, reverse radial and lateral directions), and their values are indicated in Table5.

#### ● Ball Screw Unit

Since the nut block is incorporated with a ball screw nut, model SKR is capable of receiving an axial load. The basic load rating value is indicated in Table5.

#### ● Bearing Unit (Fixed Side)

Since housing A contains an angular bearing, model SKR is capable of receiving an axial load. The basic load rating value is indicated in Table5.

### [Equivalent Load (LM Guide Unit)]

The equivalent load when the LM Guide unit of model SKR simultaneously receives loads in all directions is obtained from the following equation.

$$P_E = P_R (P_L) + P_T$$

$P_E$	: Equivalent load	(N)
	: Radial direction	
	: Reverse radial direction	
	: Lateral directions	
$P_R$	: Radial load	(N)
$P_L$	: Reverse radial load	(N)
$P_T$	: Lateral load	(N)

## Features of Each Model

## Caged Ball LM Guide Actuator Model SKR

Table5 Load Rating of Model SKR Symbols in the parentheses indicate units.

Model No.			SKR33			SKR46	
			SKR3306	SKR3310	SKR3320	SKR4610	SKR4620
LM guide unit	Basic dynamic load rating C (N)	Long nut block types A, B	17000			39500	
		Short nut block types C, D	11300			28400	
	Basic static load rating C <sub>0</sub> (N)	Long nut block types A, B	20400			45900	
		Short nut block types C, D	11500			28700	
	Radial clearance (mm)	Normal grade, high accuracy grade	0 to -0.004			0 to -0.006	
Precision grade		-0.004 to -0.012			-0.006 to -0.016		
Ball screw unit	Basic dynamic load rating C <sub>a</sub> (N)		4400	2700	2620	4350	4240
	Basic static load rating C <sub>0a</sub> (N)		6290	3780	3770	6990	7040
	Screw shaft out diameter (mm)		13			15	
	Lead (mm)		6	10	20	10	20
	Thread minor diameter (mm)		10.8			12.5	
	Ball center-to-center diameter (mm)		13.5			15.75	
Bearing unit (Fixed side)	Axial direction	Basic dynamic load rating C <sub>a</sub> (N)	6250			6700	
		Static permissible load P <sub>0a</sub> (N)	2700			3330	

Note1) The load ratings in the LM Guide unit each indicate the load rating per LM block.

Note2) With model SKR3320, a short-block type is not available.

### [Permissible Moment (LM Guide Unit)]

The LM Guide unit of model SKR is capable of receiving moments in four directions only with a single nut block. Table 6 on A-425 shows static permissible moments in the  $M_A$ ,  $M_B$  and  $M_C$  directions.

With a single long nut block (type A)

With double long nut blocks (type B)

With a single short nut block (type C)

With double short nut blocks (type D)

## Features of Each Model

## Caged Ball LM Guide Actuator Model SKR

Table6 Static Permissible Moments of Model SKR

Unit: N·m

Model No.	Static permissible moment		
	$M_A$	$M_B$	$M_C$
SKR33-A	173	173	424
SKR33-B	990	990	848
SKR33-C	58	58	240
SKR33-D	390	390	480
SKR46-A	579	579	1390
SKR46-B	3240	3240	2780
SKR46-C	236	236	870
SKR46-D	1460	1460	1740

Note1) Symbols A, B, C or D in the end of each model number indicates the nut block size and the number of nut blocks used.

A: With a single long nut block

B: With double long nut blocks

C: With a single short nut block

D: With double short nut blocks

Note2) The values for models SKR-B/D indicate the values when double nut blocks are used in close contact with each other.

## Lubrication

Standard greases used in model SKR are indicated below. For model SKR, a grease nipple can be attached per your request.

Table7

Model No.	Standard grease	THK grease nipples that can be attached
SKR33	THK AFB-LF Grease	PB107
SKR46	THK AFB-LF Grease	A-M6F

## Service Life

Caged Ball LM Guide Actuator Model SKR consists of an LM Guide, a Ball Screw and a support bearing. The service life of each component can be obtained using the basic dynamic load rating indicated in Table5 on A-423 (Rated Load of Model KR).

### [LM Guide Unit]

#### ● Nominal Life

The nominal life (L) means the total travel distance that 90% of a group of units of the same LM Guide model can achieve without flaking (scale-like pieces on the metal surface) after individually running under the same conditions.

The nominal life of the LM Guide is obtained using the following equation.

$$L = \left( \frac{f_c \cdot C}{f_w \cdot P_c} \right)^3 \times 50$$

L : Nominal life (km)       $f_w$  : Load factor (see Table8 on A-427)  
 C : Basic dynamic load rating (N)       $f_c$  : Contact factor (see Table9 on A-427)  
 $P_c$  : Calculated applied load (N)

- If a moment is applied to model SKR-A/C or model SKR-B/D using two nut blocks in close contact with each other, calculate the equivalent load by multiplying the applied moment by the equivalent factor indicated in Table10 on A-427.

$$P_m = K \cdot M$$

$P_m$  : Equivalent load (per nut block) (N)

K : Equivalent moment factor

M : Applied moment (N-mm)

(If planning to use three or more nut blocks, or use nut blocks with a wide span, contact THK.)

If moment  $M_c$  is applied to model SKR-B/D

$$P_m = \frac{K_c \cdot M_c}{2}$$

- If a radial load (P) and a moment are simultaneously applied to model SKR

$$P_E = P_m + P$$

$P_E$  : Overall equivalent radial load (N)

Perform a nominal life calculation using the above data.

#### ● Service Life Time

When the nominal life (L) has been obtained, if the stroke length and the number of reciprocations are constant, the service life time is obtained using the equation below.

$$L_h = \frac{L \times 10^6}{2 \cdot \ell_s \cdot n_1 \times 60}$$

$L_h$  : Service life time (h)       $n_1$  : Number of reciprocations per minute  
 $\ell_s$  : Stroke length (mm) (min<sup>-1</sup>)

## Features of Each Model

## Caged Ball LM Guide Actuator Model SKR

## [Ball Screw Unit/Bearing Unit(Fixed Side)]

## ● Nominal Life

The nominal life (L) means the total travel distance that 90% of a group of units of the same Ball Screw (bearing) can achieve without flaking after individually running under the same conditions. The nominal life of the Ball Screw unit/bearing unit (fixed side) is obtained using the following equation.

$$L = \left( \frac{C_a}{f_w \cdot F_a} \right)^3 \times 10^6$$

L : Nominal life (rev)  
 C<sub>a</sub> : Basic dynamic load rating (N)  
 F<sub>a</sub> : Axial load (N)  
 f<sub>w</sub> : Load factor (see Table8)

Table8 Load Factor (f<sub>w</sub>)

Vibrations/impact	Speed(V)	f <sub>w</sub>
Faint	Very low V ≤ 0.25m/s	1 to 1.2
Weak	Slow 0.25 < V ≤ 1m/s	1.2 to 1.5
Medium	Medium 1 < V ≤ 2m/s	1.5 to 2
Strong	High V > 2m/s	2 to 3.5

## ● Service Life Time

When the nominal life (L) has been obtained, if the stroke length and the number of reciprocations are constant, the service life time is obtained using the equation below.

$$L_h = \frac{L \cdot \ell}{2 \cdot \ell_s \cdot n_1 \times 60}$$

L<sub>h</sub> : Service life time (h)  
 ℓ<sub>s</sub> : Stroke length (mm)  
 n<sub>1</sub> : Number of reciprocations per minute (min<sup>-1</sup>)  
 ℓ : Ball Screw lead (mm)

■ f<sub>c</sub>: Contact Factor

If two nut blocks are used in close contact with each other with model SKR-B/D, multiply the basic load rating by the corresponding contact factor indicated in Table9.

Table9 Contact Factor (f<sub>c</sub>)

Block type	Contact factor f <sub>c</sub>
A, C type	1.0
B, D type	0.81

■ f<sub>w</sub>: Load Factor

Table8 shows load factors.

## ■ K: Moment Equivalent Factor (LM Guide Unit)

When model SKR travels under a moment, the distribution of load applied to the LM Guide is locally large. In such cases, calculate the load by multiplying the moment value by the corresponding moment equivalent factor indicated in Table10.

Symbols K<sub>A</sub>, K<sub>B</sub> and K<sub>C</sub> indicate the moment equivalent loads in the M<sub>A</sub>, M<sub>B</sub> and M<sub>C</sub> directions, respectively.

Table10 Equivalent moment factor(K)

Model No.	K <sub>A</sub>	K <sub>B</sub>	K <sub>C</sub>
SKR33-A	1.42 × 10 <sup>-1</sup>	1.42 × 10 <sup>-1</sup>	5.05 × 10 <sup>-2</sup>
SKR33-B	2.47 × 10 <sup>-2</sup>	2.47 × 10 <sup>-2</sup>	5.05 × 10 <sup>-2</sup>
SKR33-C	2.39 × 10 <sup>-1</sup>	2.39 × 10 <sup>-1</sup>	5.05 × 10 <sup>-2</sup>
SKR33-D	3.54 × 10 <sup>-2</sup>	3.54 × 10 <sup>-2</sup>	5.05 × 10 <sup>-2</sup>
SKR46-A	9.51 × 10 <sup>-2</sup>	9.51 × 10 <sup>-2</sup>	3.46 × 10 <sup>-2</sup>
SKR46-B	1.70 × 10 <sup>-2</sup>	1.70 × 10 <sup>-2</sup>	3.46 × 10 <sup>-2</sup>
SKR46-C	1.46 × 10 <sup>-1</sup>	1.46 × 10 <sup>-1</sup>	3.46 × 10 <sup>-2</sup>
SKR46-D	2.36 × 10 <sup>-2</sup>	2.36 × 10 <sup>-2</sup>	3.46 × 10 <sup>-2</sup>

K<sub>A</sub>: Moment equivalent factor in the M<sub>A</sub> direction.

K<sub>B</sub>: Moment equivalent factor in the M<sub>B</sub> direction.

K<sub>C</sub>: Moment equivalent factor in the M<sub>C</sub> direction.

Note) The values for models SKR-B/D indicate the values when double nut blocks are used in close contact with each other.

## Accuracy Standards

The accuracy of model SKR is defined in positioning repeatability, positioning accuracy, backlash and running parallelism.

### [Positioning Repeatability]

After repeating positioning to a given point in the same direction seven times, measure the halting point and obtain the value of half the maximum difference. Perform this measurement in the center and both ends of the travel distance, use the maximum value as the measurement value and express the value of half the maximum difference with symbol "±" as positioning repeatability.

Fig.8 Positioning Repeatability

### [Positioning Accuracy]

Using the maximum stroke as the reference length, express the maximum error between the actual distance traveled from the reference point and the command value in an absolute value as positioning accuracy.

Fig.9 Positioning Accuracy

### [Running of Parallelism]

Place a straightedge on the surface table where model SKR is mounted, measure almost throughout the travel distance of the nut block using a test indicator. Use the maximum difference among the readings within the travel distance as the running parallelism measurement.

Fig.10 Running of Parallelism

### [Backlash]

Feed and slightly move the nut block and read the measurement on the test indicator as the reference value. Subsequently, apply a load to the nut block from the same direction (table feed direction), and then release the nut block from the load. Use the difference between the reference value and the return as the backlash measurement.

Fig.11 Backlash

Perform this measurement in the center and near both ends, and use the maximum value as the measurement value.

**Features of Each Model**

**Caged Ball LM Guide Actuator Model SKR**

The accuracies of model SKR are classified into normal grade (no symbol), high accuracy grade (H) and precision grade (P). Tables below show standards for all the accuracies.

Table11 Normal Grade (No Symbol)

Unit: mm

Model No.	Rail length	Positioning Repeatability	Positioning Accuracy	Running of parallelism	Backlash	Starting torque (N·cm)
SKR33	150	±0.010	No standard defined	No standard defined	0.020	7
	200					
	300

		740								
		940								

Note1) The evaluation method complies with THK standards.

Note2) The starting torque represents the value when THK AFB-LF Grease is used.

Note3) If highly viscous grease such as vacuum grease and clean room grease is used, the actual starting torque may exceed the corresponding value in the table. Use much care in selecting a motor.

Note4) For accuracy with a rail length longer than the standard rail length, contact THK.

LM Guide Actuator

## Options

## LM Guide Actuator

Various types of options are available for models KR and SKR. Select an appropriate model according to your application.

Name		Reference page	Overview
Cover	Cover	A-431	Serve as contamination protection accessories or the likes
	Bellows	B-302	
Sensor	Proximity sensor	B-309	Supporting manufacturer: Yamatake, SUNX
	Photo sensor	B-310	Supporting manufacturer: Omron
	Sensor rail	B-311	For mounting a sensor
Motor bracket	Housing	A-434	For standard type model KR without a motor If the customer manufactures a motor bracket For motor wrap type
	Table of Motors Used in Model KR and Corresponding Motor Brackets	B-312	Supporting manufacturer: Yaskawa Electric, Mitsubishi Electric, Matsushita Electric, Sanyo Electric, Omron, Fanuc and Oriental Motor

# Cover

For models KR and SKR, covers are available as an option.

[\[Example of Installation\]](#)

Model SKR33(with a Cover)

dammy

# Bellows

- For dimensions of the bellows, see B-302 to B-307.

For model KR, a bellows is available for contamination protection in addition to a cover.

dammy

# Sensor

● For detailed dimensions, see B-308 to B-311.

Optional proximity sensors and photo sensors are available for models KR and SKR. Models equipped with a sensor are also provided with a dedicated sensor rail/sensor dog (detecting plate).

Some models with a short rail are attached with a sensor and sensor rail on both sides. See the table below.

## [Example of Installation]

	125L
	150L
KR26B	175L
	200L

# Motor Bracket

● For detailed dimensions, see B-312 to B-345.

## [Housing]

### ● Housing A

THK also offers Housing A for a separate motor and Turnaround Housing A as options in order to support a motor bracket or a turnaround section that the customer individually manufactures.

### ● Housing A for a Separate Motor

By using the fitting difference, the user can easily mount a separately manufactured motor bracket.

### ● Turnaround Housing A

Since the mounting holes are drilled in constant pitches, the user can select how to mount the motor bracket.

---

## Motor Wrap Type (for Reference)

---

Motor wrap types are available that allow the motor to be turned around in order to minimize the dimension in the longitudinal direction. Contact THK for details. (Pulley ratio: 1:1)

---

## XY Bracket (for Reference)

---

Brackets for installing models KR33 and 46 only are available as standard. The brackets use aluminum to reduce the weights and keep the inertia as low as possible.

## Precautions on Using Models KR/SKR

### [Handling]

- (1) Disassembling components may cause dust to enter the system or degrade mounting accuracy of parts. Do not disassemble the product.
- (2) Dropping or hitting the product may damage it. Giving an impact to the product could also cause damage to its function even if the product looks intact.

### [Lubrication]

- (1) Thoroughly remove anti-rust oil and feed lubricant before using the product.
- (2) Do not mix lubricants of different physical properties.
- (3) In locations exposed to constant vibrations or in special environments such as clean rooms, vacuum and low/high temperature, normal lubricants may not be used. Contact THK for details.
- (4) When planning to use a special lubricant, contact THK before using it.
- (5) When adopting oil lubrication, contact THK in advance.
- (6) To maximize the performance, lubrication is required. Using the product without lubrication may increase wear of the rolling elements or shorten the service life. In normal use, the lubricant must be replenished every 100 km as a guide. However, the greasing interval varies according to the conditions. We recommend determining the greasing interval based on the result of the initial inspection. For clean room applications, low dust generative AFF Grease is available. Contact THK for details.

### [Precautions on Use]

- (1) Entrance of foreign material may cause damage to the ball circulating component or functional loss. Prevent foreign material, such as dust or cutting chips, from entering the system.
- (2) When planning to use the product in an environment where the coolant penetrates the nut block, contact THK in advance.
- (3) The service temperature range of this product is 0 to 40°C (no freezing or condensation). If you consider using this product outside the service temperature range, contact THK.
- (4) Exceeding the dangerous speed may lead the components to be damaged or cause an accident. Be sure to use the product within the specification range designated by THK.
- (5) When using the product in locations exposed to constant vibrations or in special environments such as clean rooms, vacuum and low/high temperature, contact THK in advance.

### [Safety precautions]

- (1) If the product is operating or in the ready state, never touch a moving part. In addition, do not enter the operating area of the actuator.
- (2) If two or more people are involved in the operation, confirm the procedures such as a sequence, signs and anomalies in advance, and appoint another person for monitoring the operation.

### [Storage]

When storing the product, enclose it in a package designated by THK and store it in a horizontal orientation while avoiding high temperature, low temperature and high humidity.

## Structure and Features

## LM Actuator

### Feature of the LM Actuator Model GL

Fig.1 Structures of the Ball Screw Drive Type of Model GL and the Belt Drive Type of Model GL

## Structure and Features

Model GL is a single-axis actuator that allows a ball screw drive or a belt drive to be integrated with an aluminum base on which the LM Guide model GSR is mounted. For the ball screw drive type of model GL, several ball screw leads are available to select from. The belt drive type of model GL supports a long stroke.

Model GL is used mainly in conveyance-related applications.

## Structure and Features

### Feature of the LM Actuator Model GL

#### [Drive Methods are Selectable]

With model GL, two drive types are available to select from: a ball screw drive type and a belt drive type

- Ball screw specifications  
Different ball screw leads are selectable for each model number.

Table1 Ball Screw Leads by Model Numbers

	Ball Screw lead (mm)
GL 15	5, 16, 30
GL 20	5, 20, 40

- Belt drive type

Since it uses a highly rigid belt (wire woven), this type excels in high speed operation, and is not subject to restriction by dangerous speed as opposed to ball screw type. Therefore, it supports a longer stroke (up to 2720 mm for model GL20) than ball screw type. In addition, this type uses a timing pulley with different pitch circle diameter according to the model number.

Table2 Pitch Circle Diameter of the Timing Pulley

	Pitch circle diameter (P.C.D) (mm)
GL 15	35.01
GL 20	38.20

Note) When using AC servomotor drive, we recommend also using a reducer. For details, contact THK.

#### [Lightweight, High Rigidity]

The base using an extruded aluminum material has a hollow sectional shape, thus achieving lightweight and high rigidity.

Table3 Geometrical Moment of Inertia and Mass of the Aluminum Base

	Geometrical moment of inertia		Mass (kg/1000mm)
	$I_x$ (mm <sup>4</sup> )	$I_y$ (mm <sup>4</sup> )	
GL15	$2.0 \times 10^5$	$2.7 \times 10^6$	5.1
GL20	$4.62 \times 10^5$	$4.62 \times 10^6$	6.8

### Load Rating

The following table shows the load ratings of the LM Guide, the Ball Screw and the support bearing used in model GL, which will help select a specific GL model.

#### [LM Guide Unit]

Model GL uses LM Guide model GSR for its guide unit.

Table1 shows the load ratings of the LM Guide model GSR used in model GL.

Table1 Load Rating of an LM Guide

	Model No.	Basic dynamic load rating C (kN)	Basic static load rating C0 (kN)
GL 15	GSR 15V	4.31	5.59
	GSR 15T	5.69	8.43
GL 20	GSR 20V	7.01	8.82
	GSR 20T	9.22	13.2

#### [Ball Screw Unit]

The ball screw drive type of model GL uses a THK Ball Screw for its ball screw unit.

Table2 shows the load ratings of the ball screw used in the ball screw drive type of model GL.

Table2 Load Ratings of the Ball Screw Unit

	Model No.	Basic dynamic load rating Ca (kN)	Basic static load rating C0a (kN)
GL 15	BTK1605-2.6ZZ	5.4	13.3
	BLK1616-3.6ZZ	10.5	25.9
	WTF1530-2ZZ	5.6	12.4
GL 20	BTK2005-2.6ZZ	6	16.5
	BLK2020-3.6ZZ	7.7	22.3
	WTF2040-2ZZ	5.4	13.6

#### [Support Bearing Unit]

The ball screw drive type of model GL uses a THK Ball Screw for its ball screw unit.

Table3 shows the load ratings of the ball screw used in the ball screw drive type of model GL.

Table3 Load Ratings of and the Static Permissible Load of the Support Bearing Unit

	Model No.	Basic dynamic load rating Ca (N)	Static permissible load P <sub>0a</sub> (N)
GL 15	GK 10	6080	2100
GL 20	GK 12	6660	2200

## Maximum Travel Speed

The maximum travel speed of the ball screw drive type of model GL is limited by the DN value of and the dangerous speed of the ball screw regardless of the maximum rotation speed of the motor.

Table4 Maximum Travel Speed Unit: mm/sec

Base length (mm)	GL 15			GL 20		
	Lead (mm)			Lead (mm)		
	5	16	30	5	20	40
340	248	1120	2220	—	—	—
460	248	1120	2220	203	740	2247
580	248	1120	2220	203	740	2247
700	248	1120	2220	203	740	2247
820	248	1120	2120	203	707	2247
1060	203	667	1145	203	382	2127
1240	141	464	795	180	265	1480
1420	104	341	585	133	195	1087
1600	—	—	—	102	150	833
1780	—	—	—	81	118	660

LM Actuator

## Accuracy Standards

The accuracy of model GL is defined in terms of positioning repeatability.

### [Positioning Repeatability]

After repeating positioning to a given point in the same direction seven times, measure the halting point and obtain the value of half the maximum difference. Perform this measurement in the center and both ends of the travel distance, use the maximum value as the measurement value and express the value of half the maximum difference with symbol "±" as positioning repeatability.

Fig.1 Positioning Repeatability

Table5 Accuracy of Each Model Unit: mm

Drive method	Model No.	
	GL 15	GL 20
Ball screw	±0.02	±0.02
Belt	±0.08	±0.08

## Options

## LM Actuator

Various types of options are available for model GL. Select an appropriate model according to your application.

Name	Reference page	Overview
Cover	A-444	Serve as contamination protection accessories or the likes
Bellows	A-445	
Endplate	A-445	For ball screw drive type
Sensor	A-445	Proximity sensor, photo sensor
Plate nut for mounting the base	A-445	Used for securing the base mounting bolt

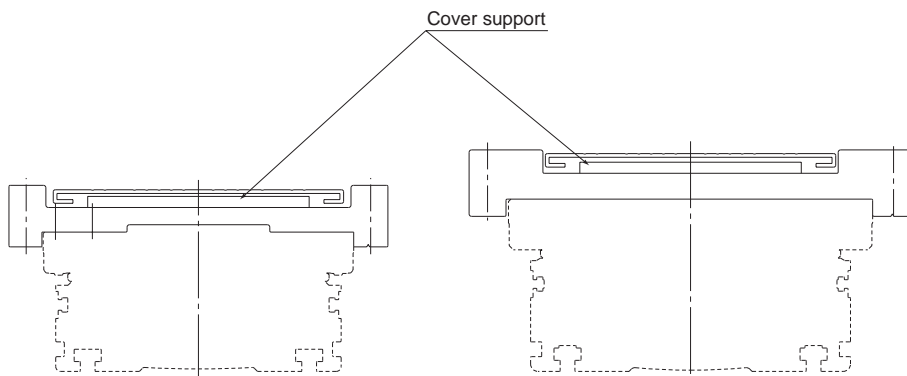

## Cover

For model GL, a cover is available for contamination protection from entering the top face.

Fig.1 Outline Drawing of the Cover

\* Greater the base length, the greater the deflection of the cover. To prevent the cover from deflecting, attach a cover support on the table (see figure below). The cover is attached as standard for models with a base length of 1060 mm or longer.

Model GL15

Model GL20

Cross section of the cover support

## Bellows

- For dimensions of the bellows, see B-358 to B-361.

For model GL, a bellows is available for contamination protection in addition to a cover.

## Endplate

- For detailed dimensions, see B-362.

With the ball screw drive type of model GL, the end plate on the motor mounting side is machined according to the motor used. Indicate the motor to be used when placing an order to THK.

## Sensor

Various types of sensors can be mounted for model GL. Contact THK for details.

GXL-N12F

TL-W3MC1

EE-SX671

Proximity sensor	GXL-N12F (SUNX) TL-W3MC1 (Omron)
Photo micro sensor	EE-SX671 (Omron)

## Plate Nut for Mounting the Base

- For detailed dimensions, see B-362.

For model GL, a plate nut for mounting the base is available. It is attached as standard when mode GL is delivered.

## Precautions on Use

## LM Actuator

### [Handling]

- (1) Disassembling parts may cause foreign material to enter the system or deteriorate the accuracy. Do not disassemble the product.
- (2) Dropping or hitting the LM Actuator model GL may damage it. Giving an impact to the Slide Rail could also cause damage to its function even if the product looks intact.

### [Lubrication]

- (1) Thoroughly remove anti-rust oil and feed lubricant before using the product.
- (2) Do not mix lubricants of different physical properties.
- (3) In locations exposed to constant vibrations or in special environments such as clean rooms, vacuum and low/high temperature, normal lubricants may not be used. Contact THK for details. For clean room applications, low dust-generative grease is available. Contact THK for details.
- (4) When planning to use a special lubricant, contact THK before using it.
- (5) To maximize the performance of the LM Actuator model GL, lubrication is required. Using the product without lubrication may increase wear of the rolling elements or shorten the service life.
- (6) In normal use, the lubricant must be replenished every 100 km as a guide. However, the greasing interval varies according to the conditions. We recommend determining the greasing interval based on the result of the initial inspection.

### [Precautions on Use]

- (1) Entrance of foreign material may cause damage to the ball circulating component or functional loss. Prevent foreign material, such as dust or cutting chips, from entering the system.
- (2) When planning to use the LM system in an environment where the coolant penetrates the LM Actuator model GL, it may cause trouble to product functions depending on the type of the coolant. Contact THK for details.
- (3) The service temperature range of this product is 0 to 40°C (no freezing or condensation). If you consider using this product outside the service temperature range, contact THK.
- (4) When using the LM system in locations exposed to constant vibrations or in special environments such as clean rooms, vacuum and low/high temperature, contact THK in advance.
- (5) Exceeding the permissible rotational speed may lead the components to be damaged or cause an accident. Be sure to use the product within the specification range designated by THK.

### [Safety precautions]

- (1) If the product is operating or in the ready state, never touch a moving part. In addition, do not enter the operating area of the actuator.
- (2) If two or more people are involved in the operation, confirm the procedures such as a sequence, signs and anomalies in advance, and appoint another person for monitoring the operation.

### [Storage]

When storing the LM Actuator model GL, enclose it in a package designated by THK and store it in a horizontal orientation while avoiding high temperature, low temperature and high humidity.

## Features and Types

## Ball Spline

### Features of the Ball Spline

Fig.1 Structure of Ball Spline Models LBS and LT

### Structure and Features

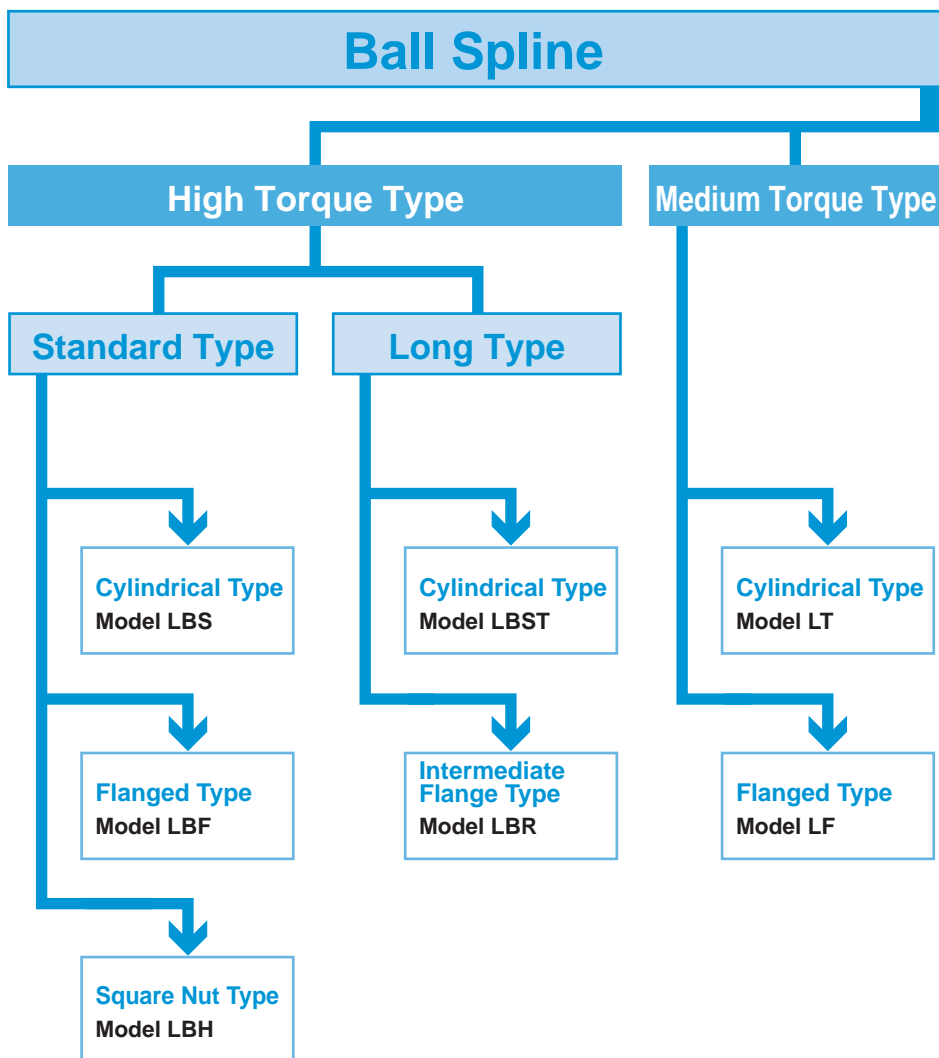

The Ball Spline is an innovative linear motion system in which balls accommodated in the spline nut transmit torque while linearly moving on precision-ground raceways on the spline shaft.

Unlike the conventional structure, a single spline nut can provide a preload with THK's Ball Spline. As a result, the Ball Spline demonstrates high performance in environments subject to vibrations and impact loads, locations where a high level of positioning accuracy is required or areas where high-speed kinetic performance is required.

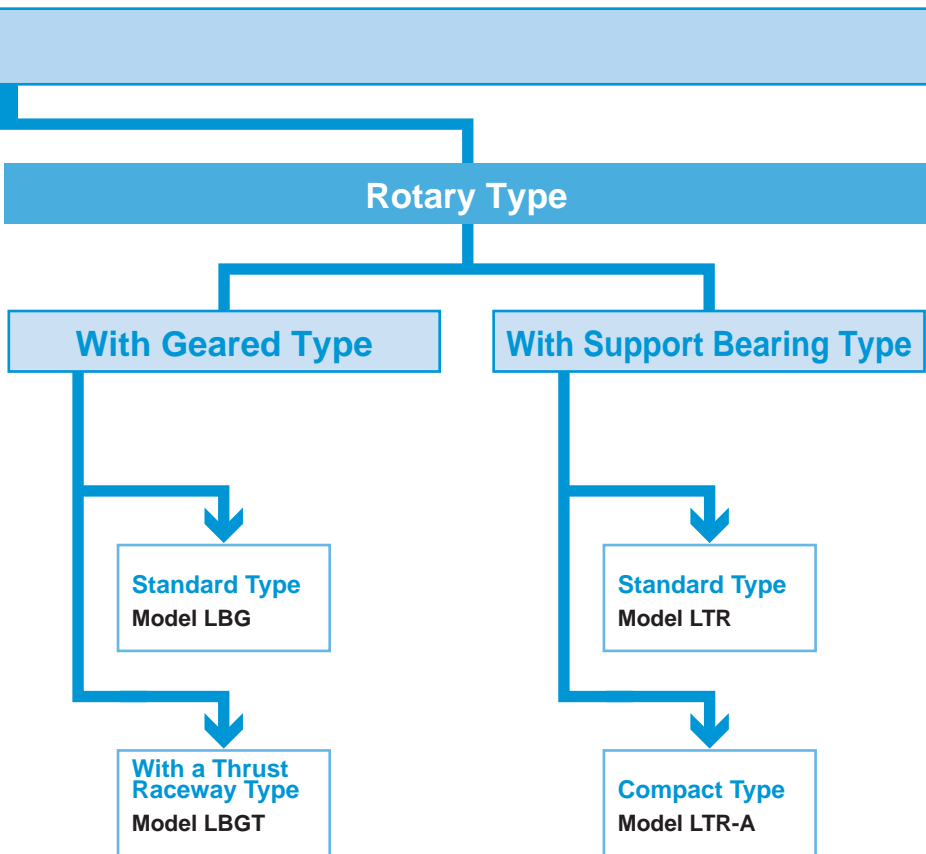

In addition, even when used as an alternative to a linear bushing, the Ball Spline achieves a rated load more than 10 times greater than the linear bushing with the same shaft diameter, allowing it to compactly be designed and used in locations where an overhung load or a moment load is applied. Thus, the Ball Spline provides a high degree of safety and long service life.

Features of the Ball Spline

## Classification of Ball Splines

dammy

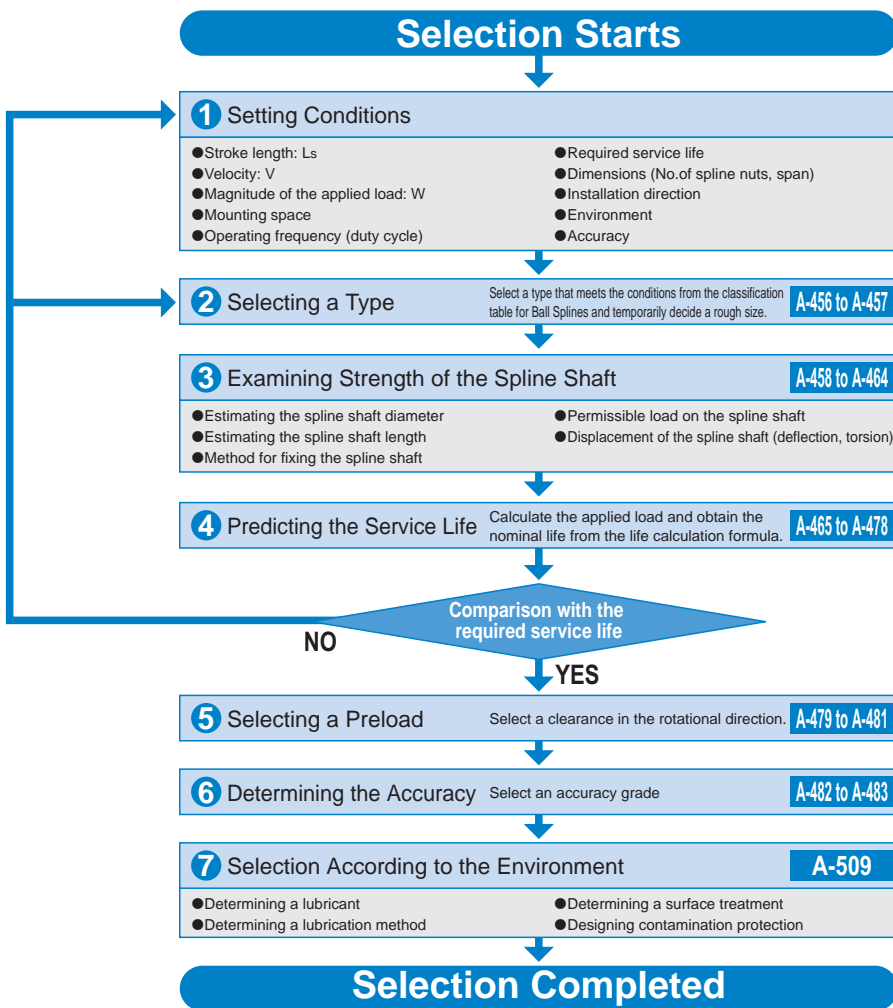

Ball Spline

# Flowchart for Selecting a Ball Spline

## Steps for Selecting a Ball Spline

The following is a flowchart as a measuring stick for selecting a Ball Spline.

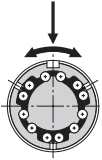

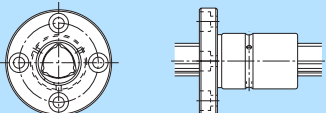

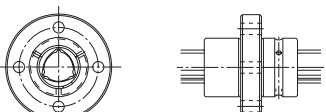

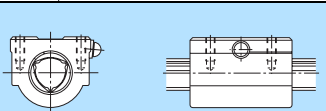

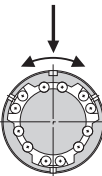

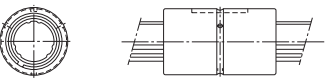

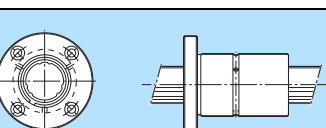

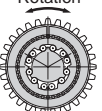

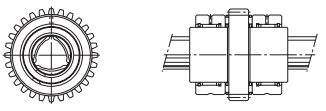

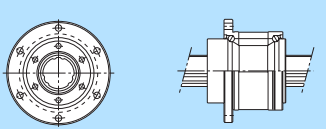

**Point of Selection**

Flowchart for **Selecting a Ball Spline**

## Selecting a Type

There are three types of the Ball Spline: high torque type, medium torque type and rotary type. You can choose a type according to the intended use. In addition, wide arrays of spline nut shapes are available for each type, enabling the user to choose a desired shape according to the mounting or service requirements.

Classification		Type	Shape	Shaft diameter
<b>High torque type</b>		Type LBS Type LBST		Nominal shaft diameter 6 to 150mm
		Type LBF		Nominal shaft diameter 15 to 100mm
		Type LBR		Nominal shaft diameter 15 to 100mm
		Type LBH		Nominal shaft diameter 15 to 50mm
<b>Medium torque type</b>		Type LT		Nominal shaft diameter 4 to 100mm
		Type LF		Nominal shaft diameter 6 to 50mm
<b>Rotary type</b>	Rotation 	Type LBG Type LBGT		Nominal shaft diameter 20 to 85mm
	Rotation 	Type LTR-A Type LTR		Nominal shaft diameter 8 to 60mm

\*For specification tables for each model, please see the separate "B Product Specifications".

## Studying the Spline Shaft Strength

The spline shaft of the Ball Spline is a compound shaft capable of receiving a radial load and torque. When the load and torque are large, the spline shaft strength must be taken into account.

### [Spline Shaft Receiving a Bending Load]

When a bending load is applied to the spline shaft of a Ball Spline, obtain the spline shaft diameter using the equation (1) below.

$$M = \sigma \cdot Z \quad \text{and} \quad Z = \frac{M}{\sigma} \quad \dots\dots\dots(1)$$

- M : Maximum bending moment acting on the spline shaft (N-mm)  
 σ : Permissible bending stress of the spline shaft (98N/mm<sup>2</sup>)  
 Z : Modulus section factor of the spline shaft (mm<sup>3</sup>)  
 (see Table3 on A-463 and Table4 on A-464)

### [Spline Shaft Receiving a Torsion Load]

When a torsion load is applied on the spline shaft of a Ball Spline, obtain the spline shaft diameter using the equation (2) below.

$$T = \tau_a \cdot Z_p \quad \text{and} \quad Z_p = \frac{T}{\tau_a} \quad \dots\dots\dots(2)$$

- T : Maximum torsion moment (N-mm)  
 τ<sub>a</sub> : Permissible torsion stress of the spline shaft (49N/mm<sup>2</sup>)  
 Z<sub>p</sub> : Polar modulus of section of the spline nut (mm<sup>3</sup>)  
 (see Table3 on A-463 and Table4 on A-464)

## Point of Selection

## Flowchart for Selecting a Ball Spline

**[When the Spline Shaft Simultaneously Receives a Bending Load and a Torsion Load]**

When the spline shaft of a Ball Spline receives a bending load and a torsion load simultaneously, calculate two separate spline shaft diameters: one for the equivalent bending moment ( $M_e$ ) and the other for the equivalent torsion moment ( $T_e$ ). Then, use the greater value as the spline shaft diameter.

**Equivalent bending moment**

$$M_e = \frac{M + \sqrt{M^2 + T^2}}{2} = \frac{M}{2} \left\{ 1 + \sqrt{1 + \left(\frac{T}{M}\right)^2} \right\} \dots\dots\dots(3)$$

$$M_e = \sigma \cdot Z$$

**Equivalent torsion moment**

$$T_e = \sqrt{M^2 + T^2} = M \cdot \sqrt{1 + \left(\frac{T}{M}\right)^2} \dots\dots\dots(4)$$

$$T_e = \tau_a \cdot Z_p$$

**[Rigidity of the Spline Shaft]**

The rigidity of the spline shaft is expressed as a torsion angle per meter of shaft length. Its value should be limited within  $1^\circ/4$ .

$$\theta = 57.3 \times \frac{T \cdot L}{G \cdot I_p} \dots\dots\dots(5)$$

$$\text{Rigidity of the shaft} = \frac{\text{Torsion angle}}{\text{Unit length}} = \frac{\theta \cdot \ell}{L} < \frac{1^\circ}{4}$$

$\theta$  : Torsion angle (°)

$L$  : Spline shaft length (mm)

$G$  : Transverse elastic modulus  
( $7.9 \times 10^4 \text{N/mm}^2$ )

$\ell$  : Unit length (1000mm)

$I_p$  : Polar moment of inertia (mm<sup>4</sup>)  
(see Table3 on A-463 and Table4 on A-464)

**[Deflection and Deflection Angle of the Spline Shaft]**

The deflection and deflection angle of the Ball Spline shaft need to be calculated using equations that meet the relevant conditions. Table1 and Table2 represent these conditions and the corresponding equations.

Table3 and Table4 (A-463 and A-464) show the modulus section (Z) and the geometrical moments of inertia (I) of the spline shaft. Using Z and I values in the tables, the strength and displacement (deflection) of a typical Ball Spline model can be obtained.

Table1 Deflection and Deflection Angle Equations

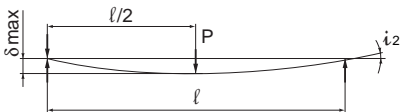

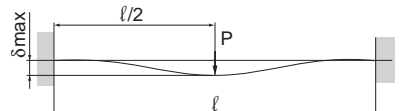

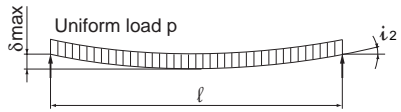

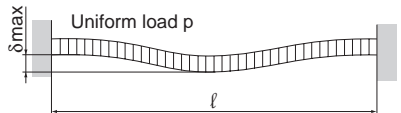

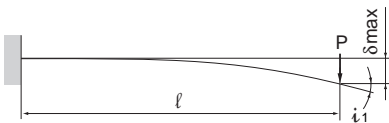

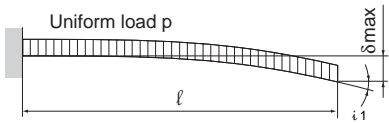

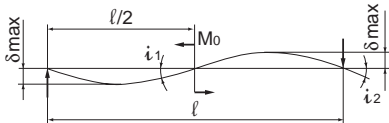

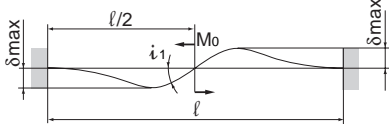

Support method	Condition	Deflection equation	Deflection angle equation
Both ends free		$\delta_{\max} = \frac{Pl^3}{48EI}$	$i_1 = 0$ $i_2 = \frac{Pl^2}{16EI}$
Both ends fastened		$\delta_{\max} = \frac{Pl^3}{192EI}$	$i_1 = 0$ $i_2 = 0$
Both ends free		$\delta_{\max} = \frac{5pl^4}{384EI}$	$i_2 = \frac{pl^3}{24EI}$
Both ends fastened		$\delta_{\max} = \frac{pl^4}{384EI}$	$i_2 = 0$

Table2 Deflection and Deflection Angle Equations

Support method	Condition	Deflection equation	Deflection angle equation
One end fastened		$\delta_{max} = \frac{Pl^3}{3EI}$	$i_1 = \frac{Pl^2}{2EI}$ $i_2 = 0$
One end fastened		$\delta_{max} = \frac{Pl^4}{8EI}$	$i_1 = \frac{Pl^3}{6EI}$ $i_2 = 0$
Both ends free		$\delta_{max} = \frac{\sqrt{3}Mol^2}{216EI}$	$i_1 = \frac{Mol}{12EI}$ $i_2 = \frac{Mol}{24EI}$
Both ends fastened		$\delta_{max} = \frac{Mol^2}{216EI}$	$i_1 = \frac{Mol}{16EI}$ $i_2 = 0$

$\delta_{max}$ : Maximum deflection(mm)

$M_0$ : Moment(N-mm)

$l$ : Span (mm)

$I$ : Geometrical moment of inertia(mm<sup>4</sup>)

$i_1$ : Deflection angle at loading point

$i_2$ : Deflection angle at supporting point

$P$ : Concentrated load(N)

$p$ : Uniform load(N/mm)

$E$ : Modulus of longitudinal elasticity  $2.06 \times 10^5$  (N/mm<sup>2</sup>)

Ball Spline

**[Dangerous Speed of the Spline Shaft]**

When a Ball Spline shaft is used to transmit power while rotating, as the rotational speed of the shaft increases, the rotation cycle nears the natural frequency of the spline shaft. It may cause resonance and eventually result in inability to move. Therefore, the maximum shaft speed must be limited to a level that does not cause resonance. If the shaft's rotation cycle exceeds or nears the resonance point during operation, it is necessary to reconsider the spline shaft diameter. The critical speed of the spline shaft is obtained using the equation (6) below, in which the value is multiplied by a safety factor of 0.8.

● **Critical Speed**

$$N_c = \frac{60\lambda^2}{2\pi \cdot \ell_b^2} \cdot \sqrt{\frac{E \times 10^3 \cdot I}{\gamma \cdot A}} \times 0.8 \quad \dots (6)$$

$N_c$  : Dangerous speed (min<sup>-1</sup>)

$\ell_b$  : Distance between two mounting surfaces (mm)

$E$  : Young's modulus (2.06 × 10<sup>5</sup> N/mm<sup>2</sup>)

$I$  : Minimum geometrical moment of inertia of the shaft (mm<sup>4</sup>)

$$I = \frac{\pi}{64} d^4 \quad d: \text{Minor diameter (mm)}$$

(see Table7 and Table8 on A-468)

$\gamma$  : Density (specific gravity)  
(7.85 × 10<sup>-6</sup>kg/mm<sup>3</sup>)

$$A = \frac{\pi}{4} d^2 \quad d: \text{Minor diameter (mm)}$$

(see Table7 and Table8 on A-468)

$A$  : Spline shaft cross-sectional area (mm<sup>2</sup>)

$\lambda$  : Factor according to the mounting method

- (1)Fixed - free  $\lambda=1.875$
- (2)Supported - supported  $\lambda=3.142$
- (3)Fixed - supported  $\lambda=3.927$
- (4)Fixed - fixed  $\lambda=4.73$

**Fixed - free**

**Supported - supported**

**Fixed - supported**

**Fixed - fixed**

For type N: see B-391 and B-408.

## Predicting the Service Life

### [Nominal Life]

The service life of a Ball Spline varies from unit to unit even if they are manufactured through the same process and used in the same operating conditions. Therefore, the nominal life defined below is normally used as a guidepost for obtaining the service life of a Ball Spline.

Nominal life is the total travel distance that 90% of a group of identical ball splines independently operating under the same conditions can achieve without showing flaking (scale-like pieces on a metal surface).

### [Calculating the Nominal Life]

The nominal life of a Ball Spline varies with types of loads applied during operation: torque load, radial load and moment load. The corresponding nominal life values are obtained using the equations (7) to (10) below. (The basic load ratings in these loading directions are indicated in the specification table for the corresponding model number.)

#### ● When a Torque Load is Applied

$$L = \left( \frac{f_r \cdot f_c}{f_w} \cdot \frac{C_T}{T_c} \right)^3 \times 50 \dots\dots\dots(7)$$

#### ● When a Radial Load is Applied

$$L = \left( \frac{f_r \cdot f_c}{f_w} \cdot \frac{C}{P_c} \right)^3 \times 50 \dots\dots\dots(8)$$

- L : Nominal life (km)
- $C_T$  : Basic dynamic torque rating (N·m)
- $T_c$  : Calculated torque applied (N·m)
- C : Basic dynamic load rating (N)
- $P_c$  : Calculated radial load (N)
- $f_r$  : Temperature factor  
(see Fig.1 on A-467)
- $f_c$  : Contact factor  
(see Table5 on A-467)
- $f_w$  : Load factor (see Table6 on A-467)

### ● When a Torque Load and a Radial Load are Simultaneously Applied

When a torque load and a radial load are simultaneously applied, calculate the nominal life by obtaining the equivalent radial load using the equation (9) below.

$$P_E = P_c + \frac{4 \cdot T_c \times 10^3}{i \cdot dp \cdot \cos \alpha} \quad \dots\dots(9)$$

$P_E$  : Equivalent radial load (N)

$\cos \alpha$  : Contact angle  $i$ =Number of rows of balls under a load

$$\left( \begin{array}{ll} \text{Type LBS} \alpha=45^\circ & i=2(\text{LBS10 or smaller}) \\ & i=3(\text{LBS15 or greater}) \\ \text{Type LT} \alpha=70^\circ & i=2(\text{LT13 or smaller}) \\ & i=3(\text{LT16 or greater}) \end{array} \right)$$

$dp$  : Ball center-to-center diameter (mm)  
(see Table7 and Table8 on A-468)

### ● When a Moment Load is Applied to a Single Nut or Two Nuts in Close Contact with Each Other

Obtain the equivalent radial load using the equation (10) below.

$$P_u = K \cdot M \quad \dots\dots(10)$$

$P_u$  : Equivalent radial load (N)  
(with a moment applied)

$K$  : Equivalent Factors (see Table9 on A-471, Table10 on A-472)

$M$  : Applied moment (N-mm)

However,  $M$  should be within the range of the static permissible moment.

### ● When a Moment Load and a Radial Load are Simultaneously Applied

Calculated the nominal life from the sum of the radial load and the equivalent radial load.

### ● Calculating the Service Life Time

When the nominal life ( $L$ ) has been obtained in the equation above, if the stroke length and the number of reciprocations per minute are constant, the service life time is obtained using the equation (11) below.

$$L_h = \frac{L \times 10^3}{2 \times l_s \times n_1 \times 60} \quad \dots\dots(11)$$

$L_h$  : Service life time (h)

$l_s$  : Stroke length (m)

$n_1$  : Number of reciprocations per minute (opm)

**Point of Selection**

**Flowchart for Selecting a Ball Spline**

**■ $f_t$ : Temperature Factor**

If the temperature of the environment surrounding the operating Ball Spline exceeds 100 °C, take into account the adverse effect of the high temperature and multiply the basic load ratings by the temperature factor indicated in Fig.1.

In addition, the Ball Spline must be of a high temperature type.

Note) If the environment temperature exceeds 80 °C, high-temperature types of seal and retainer are required. Contact THK for details.

Fig.1 Temperature Factor ( $f_t$ )

**■ $f_c$ : Contact Factor**

When multiple spline nuts are used in close contact with each other, their linear motion is affected by moments and mounting accuracy, making it difficult to achieve uniform load distribution. In such applications, multiply the basic load rating (C) and ( $C_0$ ) by the corresponding contact factor in Table5.

Note) If uneven load distribution is expected in a large machine, take into account the respective contact factor indicated in Table5.

Table5 Contact Factor ( $f_c$ )

Number of spline nuts in close contact with each other	Contact factor $f_c$
2	0.81
3	0.72
4	0.66
5	0.61
Normal use	1

**■ $f_w$ : Load Factor**

In general, reciprocating machines tend to involve vibrations or impact during operation. It is extremely difficult to accurately determine vibrations generated during high-speed operation and impact during frequent start and stop. When loads applied on a Ball Spline cannot be measured, or when speed and impact have a significant influence, divide the basic load rating (C or  $C_0$ ), by the corresponding load factor in the table of empirically obtained data on Table6.

Table6 Load Factor ( $f_w$ )

Vibrations/ impact	Speed(V)	$f_w$
Faint	Very low $V \leq 0.25\text{m/s}$	1 to 1.2
Weak	Slow $0.25 < V \leq 1\text{m/s}$	1.2 to 1.5
Medium	Medium $1 < V \leq 2\text{m/s}$	1.5 to 2
Strong	High $V > 2\text{m/s}$	2 to 3.5

Table7 Sectional Shape of the Spline Shaft for Models LBS, LBST, LBF, LBR, LBH, LBG and LBGT

Unit: mm

Nominal shaft diameter	15	20	25	30	40	50	60	70	85	100	120	150

\* The minor diameter  $\phi d$  must be a value at which no groove is left after machining.

Nominal shaft diameter: 13 mm or less

Nominal shaft diameter: 16 mm or more

**[Calculating the Average Load]**

When the load applied on the spline shaft fluctuates according to varying conditions, such as an industrial robot arm traveling forward while holding a workpiece and traveling backward with empty weight, and a machine tool handling various workpieces, this varying load condition must be taken into account in service life calculation.

The average load ( $P_m$ ) is a constant load under which the service life of an operating Ball Spline with its spline nut receiving a fluctuation load in varying conditions is equivalent to the service life under this varying load condition.

The following is the basic equation.

$$P_m = \sqrt[3]{\frac{1}{L} \cdot \sum_{n=1}^n (P_n^3 \cdot L_n)}$$

- $P_m$  : Average Load (N)
- $P_n$  : Varying load (N)
- $L$  : Total travel distance (mm)
- $L_n$  : Distance traveled under  $P_n$  (mm)

● **When the Load Fluctuates Stepwise**

$$P_m = \sqrt[3]{\frac{1}{L} (P_1^3 \cdot L_1 + P_2^3 \cdot L_2 + \dots + P_n^3 \cdot L_n)} \dots\dots\dots(1)$$

- $P_m$  : Average Load (N)
- $P_n$  : Varying load (N)
- $L$  : Total travel distance (m)
- $L_n$  : Distance traveled under load  $P_n$  (m)

Fig.2

● When the Load Fluctuates Monotonically

$$P_m \doteq \frac{1}{3} (P_{min} + 2 \cdot P_{max}) \dots\dots\dots (2)$$

$P_{min}$  : Minimum load (N)

$P_{max}$  : Maximum load (N)

Fig.3

● When the Load Fluctuates Sinusoidally

(a)  $P_m \doteq 0.65P_{max} \dots\dots\dots (3)$

(b)  $P_m \doteq 0.75P_{max} \dots\dots\dots (4)$

Fig.4

[Equivalent Factor]

Table9 below and Table10 on A-472 show equivalent radial load factors calculated under a moment load.

● Table of Equivalent Factors for Ball Spline Model LBS

Table9

Model No.	Equivalent factor: K	
	Single spline nut	Two spline nuts in close contact with each other

Ball Spline

Note1) Values of equivalent factor K for model LBF are the same as that for model LBS.

Note2) Values of equivalent factor K for models LBR, LBG, LBGT and LBH are the same as that for model LBST.

However the values of model LBF60 are the same as that for model LBST60.

The values of model LBH15 are the same as that for model LBS15.

### ● Table of Equivalent Factors for Ball Spline Model LT

Table10

Model No.	Equivalent factor: K	
	Single spline nut	Two spline nuts in close contact with each other
LT 4	0.65	0.096
LT 5	0.55	0.076
LT 6	0.47	0.06
LT 8	0.47	0.058
LT 10	0.31	0.045
LT 13	0.3	0.042
LT 16	0.19	0.032
LT 20	0.16	0.026
LT 25	0.13	0.023
LT 30	0.12	0.02
LT 40	0.088	0.016
LT 50	0.071	0.013
LT 60	0.07	0.011
LT 80	0.062	0.009
LT100	0.057	0.008

Note) Values of equivalent factor K for model LF are the same as that for model LT.

[Example of Calculating the Service Life]

● Example of Calculation - 1

An industrial robot arm (horizontal)

[Conditions]

Mass applied to the arm end  $m=50\text{kg}$

Arm length at maximum stroke  $L_{\text{max}}=400\text{mm}$

Stroke  $l_s=200\text{mm}$

$L_2=325\text{mm}$

Spline nut mounting span (estimate)  $L_1=150\text{mm}$

$L_3=50\text{mm}$

A arrow view

(The Ball Spline type is LBS in this example.)

Fig.5

■ Shaft Strength Calculation

Calculate the bending moment (M) and the torsion moment (T) applied on the shaft.

$$M = m \times 9.8 \times L_{\text{max}} = 196000\text{N}\cdot\text{mm}$$

$$T = m \times 9.8 \times L_3 = 24500\text{N}\cdot\text{mm}$$

Since the bending and torsion moments are applied simultaneously, obtain the corresponding bending moment ( $M_e$ ) and torsion moment ( $T_e$ ), and then determine the shaft diameter based on the greater value. From equations (3) and (4) on A-459,

$$M_e = \frac{M + \sqrt{M^2 + T^2}}{2} \doteq 196762.7\text{N} \cdot \text{mm}$$

$$T_e = \sqrt{M^2 + T^2} \doteq 197525.3\text{N} \cdot \text{mm}$$

$$M_e < T_e$$

∴  $T_e = \tau_a \times Z_p$  Hence,

$$Z_p = \frac{T_e}{\tau_a} \doteq 4031\text{mm}^3$$

Thus, judging from Table3 on A-463, the nominal shaft diameter that meets  $Z_p$  is at least 40 mm.

### ■Average Load $P_m$

Obtain an applied load value when the arm is extended to the maximum length ( $P_{max}$ ), and another when the arm is contracted ( $P_{min}$ ). Based on the values obtained, calculate the average load on the spline shaft nut.

$$P_{1max} = \frac{m \times 9.8 (L_1 + L_2)}{L_1} \doteq 1551.7N$$

$$P_{2max} = \frac{m \times 9.8 \times L_2}{L_1} \doteq 1061.7N$$

When the arm is contracted

$$P_{1min} = \frac{m \times 9.8 \times [(L_2 - l_s) + L_1]}{L_1} \doteq 898.3N$$

$$P_{2min} = \frac{m \times 9.8 \times (L_2 - l_s)}{L_1} \doteq 408.3N$$

As this load is monotonically varying as shown in the Fig.3 on A-470, calculate the average load using the equation (2) on A-470.

The average load ( $P_{1m}$ ) on spline nut 1

$$P_{1m} \doteq \frac{1}{3} (P_{1min} + 2P_{1max}) = 1333.9N$$

The average load ( $P_{2m}$ ) on spline nut 2

$$P_{2m} \doteq \frac{1}{3} (P_{2min} + 2P_{2max}) = 843.9N$$

Obtain the torque applied on one spline nut.

$$T = \frac{m \times 9.8 \times L_3}{2} = 12250N \cdot mm$$

Since the radial load and the torque are simultaneously applied, calculate the equivalent radial load using equation (9) on A-466.

$$P_{1E} = P_{1m} + \frac{4 \times T}{3 \times dp \times \cos \alpha} = 1911.4N$$

$$P_{2E} = P_{2m} + \frac{4 \times T}{3 \times dp \times \cos \alpha} = 1421.4N$$

### ■Nominal Life $L_n$

Based on the nominal life equation (8) on A-465, each nominal life is obtained as follows.

$$\text{Nominal life of the spline nut } L_1 = \left( \frac{f_T \times f_C}{f_W} \times \frac{C}{P_{1E}} \right)^3 \times 50 = 68867.4km$$

$$\text{Nominal life of the spline nut } L_2 = \left( \frac{f_T \times f_C}{f_W} \times \frac{C}{P_{2E}} \right)^3 \times 50 = 167463.2km$$

$f_r$ : Temperature factor = 1 (from Fig.1 on A-467)  
 $f_c$ : Contact factor = 1 (from Table5 on A-467)  
 $f_w$ : Load factor = 1.5 (from Table6 on A-467)  
 C: Basic dynamic load rating = 31.9 kN (model LBS40)

Given the nominal life obtained for each spline nut above, the nominal life of the Ball Spline unit is equal to that of spline nut 1, which is 68867.4km.

● **Example of Calculation - 2**

[Conditions]

Thrust position:  $F_s$

Stroke velocity:  $V_{max} = 0.25\text{m/sec}$

Acceleration:  $a=0.36\text{m/sec}^2$  (from the respective velocity diagram)

Stroke:  $S=700\text{mm}$

Housing mass:  $m_1=30\text{kg}$

Arm mass :  $m_2=20\text{kg}$

Head mass:  $m_3=15\text{kg}$

Work mass:  $m_4=12\text{kg}$

Distance from the thrust position to each mass

$l_1=200\text{mm}$   $l_2=500\text{mm}$

$l_3=1276\text{mm}$

Cycle (1 cycle: 30 sec)

1. Descent (3.5sec) 2.Dwell (1sec): with a work
3. Ascend (3.5sec) 4.Dwell (7sec)
5. Descent (3.5sec) 6.Dwell (1sec): without a work
7. Ascend (3.5sec) 8.Dwell (7sec)

Ball Spline

Fig.6

### ■ Shaft Strength Calculation

Calculate the shaft strength while assuming the shaft diameter to be 60 mm. (with double spline nut in contact with each other)

### ■ Calculating the Moment ( $M_n$ ) Applying on the Spline Nut during Acceleration, Uniform Motion and Deceleration with Different Masses ( $m_n$ )

Applied moment during deceleration:  $M_1$

$$M_1 = m_n \times 9.8 \left(1 \pm \frac{a}{g}\right) \times l_n \quad \dots\dots(a)$$

Applied moment during uniform motion:  $M_2$

$$M_2 = m_n \times 9.8 \times l_n \quad \dots\dots(b)$$

Applied moment during deceleration:  $M_3$

$$M_3 = m_n \times 9.8 \left(1 \pm \frac{a}{g}\right) \times l_n \quad \dots\dots(c)$$

$m_n$ : Mass (kg)

$a$  : Acceleration (m/sec<sup>2</sup>)

$g$  : Gravitational acceleration(m/sec<sup>2</sup>)

$l_n$  : Offset from each loading point to the trust center(mm)

Assume:

$$A = \left(1 + \frac{a}{g}\right), \quad B = \left(1 - \frac{a}{g}\right)$$

#### ● During descent

From equation (c), during acceleration

$$\begin{aligned} M_{m1} &= m_1 \times 9.8 \times B \times l_1 + m_2 \times 9.8 \times B \times (l_1 + l_2) + m_3 \times 9.8 \times B \times (l_1 + l_3) \\ &= 398105.01 \text{N-mm} \end{aligned}$$

From equation (b), during uniform motion

$$\begin{aligned} M_{m2} &= m_1 \times 9.8 \times l_1 + m_2 \times 9.8 \times (l_1 + l_2) + m_3 \times 9.8 \times (l_1 + l_3) \\ &= 412972 \text{N-mm} \end{aligned}$$

From equation (a), during deceleration

$$\begin{aligned} M_{m3} &= m_1 \times 9.8 \times A \times l_1 + m_2 \times 9.8 \times A \times (l_1 + l_2) + m_3 \times 9.8 \times A \times (l_1 + l_3) \\ &= 427838.99 \text{N-mm} \end{aligned}$$

#### ● During ascent

From equation (a), during acceleration

$$\begin{aligned} M_{m1}' &= m_1 \times 9.8 \times A \times l_1 + m_2 \times 9.8 \times A \times (l_1 + l_2) + m_3 \times 9.8 \times A \times (l_1 + l_3) \\ &= 427838.99 \text{N-mm} \end{aligned}$$

From equation (b), during uniform motion

$$\begin{aligned} M_{m2}' &= m_1 \times 9.8 \times l_1 + m_2 \times 9.8 \times (l_1 + l_2) + m_3 \times (l_1 + l_3) \\ &= 412972 \text{N-mm} \end{aligned}$$

From equation (c), during deceleration

$$M_{m3}' = m_1 \times 9.8 \times B \times l_1 + m_2 \times 9.8 \times B \times (l_1 + l_2) + m_3 \times 9.8 \times B \times (l_1 + l_3) \\ = 398105.01 \text{ N}\cdot\text{mm}$$

- During descent (with a work loaded)

From equation (c), during acceleration

$$M_{m1}'' = M_{m1} + m_4 \times 9.8 \times B \times (l_1 + l_3) \\ = 565433.83 \text{ N}\cdot\text{mm}$$

From equation (b), during uniform motion

$$M_{m2}'' = M_{m2} + m_4 \times 9.8 \times (l_1 + l_3) \\ = 586549.6 \text{ N}\cdot\text{mm}$$

From equation (a), during deceleration

$$M_{m3}'' = M_{m3} + m_4 \times 9.8 \times A \times (l_1 + l_3) \\ = 607665.37 \text{ N}\cdot\text{mm}$$

- During ascent (with a work loaded)

From equation (a), during acceleration

$$M_{m1}''' = M_{m1}' + m_4 \times 9.8 \times A \times (l_1 + l_3) \\ = 607665.37 \text{ N}\cdot\text{mm}$$

From equation (b), during uniform motion

$$M_{m2}''' = M_{m2}' + m_4 \times 9.8 \times (l_1 + l_3) \\ = 586549.6 \text{ N}\cdot\text{mm}$$

From equation (c), during deceleration

$$M_{m3}''' = M_{m3}' + m_4 \times 9.8 \times B \times (l_1 + l_3) \\ = 565433.83 \text{ N}\cdot\text{mm}$$

$$\therefore M_1 = M_{m1} = M_{m3}' = 398105.01 \text{ N}\cdot\text{mm}$$

$$M_2 = M_{m2} = M_{m2}' = 412972 \text{ N}\cdot\text{mm}$$

$$M_3 = M_{m3} = M_{m1}' = 427838.99 \text{ N}\cdot\text{mm}$$

$$M_1' = M_{m1}'' = M_{m3}''' = 565433.83 \text{ N}\cdot\text{mm}$$

$$M_2' = M_{m2}'' = M_{m2}''' = 586549.6 \text{ N}\cdot\text{mm}$$

$$M_3' = M_{m3}'' = M_{m1}''' = 607665.37 \text{ N}\cdot\text{mm}$$

**Calculating the Equivalent Radial Load Considered to be Applied to the Spline Nut with Different Moments**

Relational expression between moment  $M_n$  and  $P_n$

$P_n = M_n \times K$

.....(d)

$P_n$  : Equivalent radial load (N)

$M_n$  : Applied moment (N-mm)

$K$  : Equivalent factor (from Table9 to A-471)  
(If two spline nuts of LBF60 contact with each other,  $K = 0.013$ )

Calculate the equivalent radial load with different applied moments using equation (d).

$P_{m1} = P_{m3}' = M_1 \times 0.013 \doteq 5175.4N$

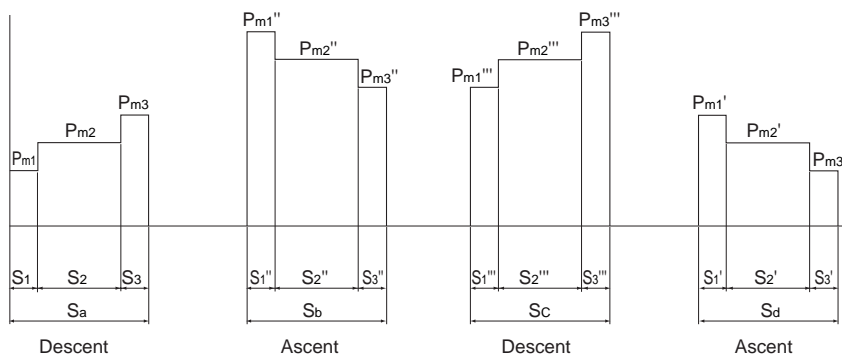

$P_{m2} = P_{m2}' = M_2 \times 0.013 \doteq 5368.6N$

$P_{m3} = P_{m1}' = M_3 \times 0.013 \doteq 5561.9N$

$P_{m1}'' = P_{m3}''' = M_1' \times 0.013 \doteq 7350.7N$

$P_{m2}'' = P_{m2}''' = M_2' \times 0.013 \doteq 7625.2N$

$P_{m3}' = P_{m1}''' = M_3' \times 0.013 \doteq 7899.7N$

$$\begin{cases} P_1 = P_{m1} = P_{m3}' \doteq 5175.4N \\ P_2 = P_{m2} = P_{m2}' \doteq 5368.6N \\ P_3 = P_{m3} = P_{m1}' \doteq 5561.9N \end{cases}$$

$$\begin{cases} P_4 = P_{m1}'' = P_{m3}''' \doteq 7350.7N \\ P_5 = P_{m2}'' = P_{m2}''' \doteq 7625.2N \\ P_6 = P_{m3}'' = P_{m1}''' \doteq 7899.7N \end{cases}$$

$$\begin{cases} S = S_a = S_b = S_c = S_d = 700mm \\ S_1 = S_1' = S_1'' = S_1''' = S_1'''' = 87.5mm \\ S_2 = S_2' = S_2'' = S_2''' = S_2'''' = 525mm \\ S_3 = S_3' = S_3'' = S_3''' = S_3'''' = 87.5mm \end{cases}$$

**Calculating the Average Load  $P_m$**

Using equation (1) on A-469,

$$P_m = \sqrt[3]{\frac{1}{4 \times S} \{ 2 \{ (P_1^3 \times S_1) + (P_2^3 \times S_2) + (P_3^3 \times S_3) \} + 2 \{ (P_4^3 \times S_3) + (P_5^3 \times S_2) + (P_6^3 \times S_1) \} \}}$$

$\doteq 6689.5N$

**Calculating the Rated Life L from the Average Load**

Using equation (8) on A-465,

$$L = \left( \frac{f_T \cdot f_c}{f_w} \cdot \frac{C}{P_m} \right)^3 \times 50$$

$= 7630km$

- $f_T$  : Temperature factor = 1 (from Fig.1 on A-467)
- $f_c$  : Contact factor=0.81 (from Table5 on A-467)
- $f_w$  : Load factor=1.5 (from Table6 on A-467)
- $C$  : Basic dynamic load rating = 66.2 kN (model LBF60)

Given the result above, the nominal life of model LBF60 with double spline nuts used in close contact with each other is 7,630 km.

## Selecting a Preload

A preload on the Ball Spline significantly affects its accuracy, load resistance and rigidity. Therefore, it is necessary to select the most appropriate clearance according to the intended use.

Specific clearance values are standardized for each model, allowing you to select a clearance that meets the conditions.

### Clearance in the Rotation Direction

With the Ball Spline, the sum of clearances in the circumferential direction is standardized as the clearance in the rotational direction. For models LBS and LT, which are especially suitable for transmission of rotational torque, clearances in the rotational directions are defined.

#### Clearance in the rotational direction (BCD)

Fig.7 Measurement of Clearance in the Rotational Direction

### Preload and Rigidity

Preload is defined as the load preliminarily applied to the ball in order to eliminate angular backlash (clearance in the rotational direction) and increase rigidity. When given a preload, the Ball Spline is capable of increasing its rigidity by eliminating the angular backlash according to the magnitude of the preload. Fig.8 shows the displacement in the rotational direction when a rotational torque is applied.

Thus, the effect of a preload can be obtained up to 2.8 times that of the applied preload. When given the same rotational torque, the displacement when a preload is applied is 0.5 or less of that without a preload. The rigidity with a preload is at least twice greater than that without a preload.

Fig.8

## Conditions and Guidelines for Selecting of a Preload

Table11 provides guidelines for selecting a clearance in the rotational direction with given conditions of the Ball Spline.

The rotational clearance of the Ball Spline significantly affects the accuracy and rigidity of the spline nut. Therefore, it is essential to select a correct clearance according to the intended use. Generally, the Ball Spline is provided with a preload. When it is used in repeated circular motion or reciprocating straight motion, the Ball Spline is subject to a large vibration impact, and therefore, its service life and accuracy are significantly increased with a preload.

Table11 Guidelines for Selecting a Clearance in the Rotational Direction for the Ball Spline

Clearance in the rotation direction	Condition	Examples of applications
Normal grade (No symbol)	<ul style="list-style-type: none"> <li>Smooth motion with a small force is desired.</li> <li>A torque is always applied in the same direction.</li> </ul>	<ul style="list-style-type: none"> <li>Measuring instruments</li> <li>Automatic drafting machine</li> <li>Geometrical measuring equipment</li> <li>Dynamometer</li> <li>Wire winder</li> <li>Automatic welding machine</li> <li>Main shaft of honing machine</li> <li>Automatic packing machine</li> </ul>

# Determining the Accuracy

## Accuracy Grades

The accuracy of the Ball Spline is classified into three grades: normal grade (no symbol), high accuracy grade (H) and precision grade (P), according to the runout of spline nut circumference in relation to the support of the spline shaft. Fig.11 shows measurement items.

Fig.11 Accuracy Measurement Items of the Ball Spline

## Accuracy Standards

Table16 to Table19 show measurement items of the Ball Spline.

Table16 Runout of the Spline Nut Circumference in Relation to the Support of the Spline Shaft

Unit: μm

Accuracy		Runout(max)																							
Nominal shaft diameter		4 to 8 <sup>Note</sup>			10			13 to 20			25 to 32			40, 50			60 to 80			85 to 120			150

# High Torque Type Ball Spline

Models LBS, LBF, LBH, LBST and LBR

Fig.1 Structure of High Torque Type Ball Spline Model LBS

## Structure and Features

With the high torque type Ball Spline, the spline shaft has three crests positioned equidistantly at  $120^\circ$ , and along both sides of each crest, two rows of balls (six rows in total) are arranged so as to hold the crest, as shown in Fig.1.

The raceways are precision ground into R-shaped grooves whose diameters are approximate to the ball diameter. When a torque is generated from the spline shaft or the spline nut, the three rows of balls on the load-bearing side evenly receive the torque, and the center of rotation is automatically determined. When the rotation reverses, the remaining three rows of balls on the unloaded side receive the torque.

The rows of balls are held in a retainer incorporated in the spline nut so that they smoothly roll and circulate. With this design, balls will not fall even if the spline shaft is removed from the nut.

### [No Angular Backlash]

With the high torque type Ball Spline, a single spline nut provides a preload to eliminate angular backlash and increase the rigidity.

Unlike conventional ball splines with circular-arc groove or Gothic-arch groove, the high torque type Ball Spline eliminates the need for twisting two spline nuts to provide a preload, thus allowing compact design to be achieved easily.

## Features of Each Model

### High Torque Type Ball Spline

#### [High Rigidity and Accurate Positioning]

Since this model has a large contact angle and provides a preload from a single spline nut, the initial displacement is minimal and high rigidity and high positioning accuracy are achieved.

#### [High-speed Motion, High-speed Rotation]

Adoption of a structure with high grease retention and a rigid retainer enables the ball spline to operate over a long period with grease lubrication even in high-speed straight motion. Since the distance in the radius direction is almost uniform between the loaded balls and the unloaded balls, the balls are little affected by the centrifugal force and smooth straight motion is achieved even during high-speed rotation.

#### [Compact Design]

Unlike conventional ball splines, unloaded balls do not circulate on the outer surface of the spline nut with this model. As a result, the outer diameter of the spline nut is reduced and a space-saving and compact design is achieved.

#### [Ball Retaining Type]

Use of a retainer prevents the balls from falling even if the spline shaft is pulled out of the spline nut.

#### [Can be Used as a Linear Bushing for Heavy Loads]

Since the raceways are machined into R grooves whose diameter is almost equal to the ball diameter, the contact area of the ball is large and the load capacity is large also in the radial direction.

#### [Double, Parallel Shafts can be Replaced with a Single Shaft]

Since a single shaft is capable of receiving a load in the torque direction and the radial direction, double shafts in parallel configuration can be replaced with a single-shaft configuration. This allows easy installation and achieves space-saving design.

---

## Applications

---

The high torque type Ball Spline is a reliable straight motion system used in a wide array of applications such as the columns and arms of industrial robot, automatic loader, transfer machine, automatic conveyance system, tire forming machine, spindle of spot welding machine, guide shaft of high-speed automatic coating machine, riveting machine, wire winder, work head of electric discharge machine, spindle drive shaft of grinding machine, speed gears and precision indexing shaft.

---

## Types and Features

---

### [Types of Spline Nuts]

#### Cylindrical Type Ball Spline Model LBS (Medium Load Type) [Specification Table⇒B-368](#)

The most compact type with a straight cylindrical spline nut. When transmitting a torque, a key is driven into the body. The outer surface of the spline nut is provided with anti-carbonation treatment.

#### Cylindrical Type Ball Spline Model LBST (Heavy Load Type) [Specification Table⇒B-372](#)

A heavy load type that has the same spline nut diameter as model LBS, but has a longer spline nut length. It is optimal for locations where the space is small, a large torque is applied, and an overhang load or moment load is applied.

#### Flanged Type Ball Spline Model LBF [Specification Table⇒B-374](#)

The spline nut can be attached to the housing via the flange, making assembly simple. It is optimal for locations where the housing may be deformed if a keyway is machined on its surface, and where the housing width is small.

Since it allows a dowel pin to be driven into the flange, angular backlash occurring in the fitting can completely be eliminated.

dammy

dammy

## Flanged Type Ball Spline Model LBR

[Specification Table⇒B-376](#)

Based on the heavy load type model LBST, this model has a flange in the central area, making itself optimal for locations under a moment load such as arms of industrial robots.

## Rectangular Type Ball Spline Model LBH

[Specification Table⇒B-378](#)

Its rigid rectangular spline nut does not require a housing and can be directly mounted on the machine body. Thus, a compact, highly rigid linear guide system is achieved.

### [Types of Spline Shafts]

## Precision Solid Spline Shaft (Standard Type)

---

The spline shaft is cold-drawn and its raceway is precision ground. It is used in combination with a spline nut.

## Special Spline Shaft

---

THK manufactures a spline shaft with thicker ends or thicker middle area through special processing at your request.

## Hollow Spline Shaft (Type K)

---

A drawn, hollow spline shaft is available for requirements such as piping, wiring, air-vent and weight reduction.

---

## Service Life

---

For details, see A-465.

---

## Clearance in the Rotation Direction

---

For details, see A-481.

---

## Accuracy Standards

---

For details, see A-482.

---

## Housing Inner-diameter Tolerance

---

When fitting the Ball Spline with the housing, tight fitting is normally recommended. If the accuracy of the Ball Spline does not need to be very high, clearance fitting is also acceptable.

Table1 Housing Inner-diameter Tolerance

Housing Inner-diameter Tolerance	General conditions	H7
	When clearance needs to be small	J6

---

## Spline Shaft

---

Spline shafts are divided in shape into precision solid spline shaft, special spline shaft and hollow spline shaft (type K), as described on A-488.

For details, see B-381 to B-383.

---

## Accessories

---

Ball Spline models LBS and LBST are provided with a standard key.

For detailed dimensions, see B-384.

# Medium Torque Type Ball Spline

Models LT and LF

Fig.1 Structure of Medium Torque Type Ball Spline Model LT

## Structure and Features

With the medium torque type Ball Spline, the spline shaft has two to three crests on the circumference, and along both sides of each crest, two rows of balls (four or six rows in total) are arranged to hold the crest so that a reasonable preload is applied.

The rows of balls are held in a special resin retainer incorporated in the spline nut so that they smoothly roll and circulate. With this design, balls will not fall even if the nut is removed from the spline shaft.

### [Large Load Capacity]

The raceways are formed into circular-arc grooves approximate to the ball curvature and ensure angular contact. Thus, this model has a large load capacity in the radial and torque directions.

### [No Angular Backlash]

Two rows of balls facing one another hold a crest, formed on the circumference of the spline nut, at a contact angle of  $20^\circ$  to provide a preload in an angular-contact structure. This eliminates an angular backlash in the rotational direction and increases the rigidity.

## Features of Each Model

### Medium Torque Type Ball Spline

#### [High Rigidity]

Since the contact angle is large and an appropriate preload is given, high rigidity against torque and moment is achieved.

#### [Ball Retaining Type]

Use of a retainer prevents the balls from falling even if the spline shaft is pulled out of the spline nut. (except for models LT4 and 5)

---

## Types and Features

---

[Types of Spline Nuts]

### Cylindrical Type Ball Spline Model LT

Specification Table⇒B-386

The most compact type with a straight cylindrical spline nut. When transmitting a torque, a key is driven into the body.

---

### Flanged Type Ball Spline Model LF

Specification Table⇒B-388

The spline nut can be attached to the housing via the flange, making assembly simple.

It is optimal for locations where the housing may be deformed if a keyway is machined on its surface, and where the housing width is small.

Since it allows a dowel pin to be driven into the flange, angular backlash occurring in the fitting can completely be eliminated.

**Features of Each Model**

Medium Torque Type Ball Spline

Ball Spline

# Rotary Ball Spline With Geared type

Models LBG and LBGT

Fig.1 Structure of Rotary Ball Spline Model LBG

## Structure and Features

With the Rotary Ball Spline, the spline shaft has three crests, and along both sides of each crest, two rows of balls (six rows in total) are arranged to hold the crest so that a reasonable preload is applied. These models are unit types based on model LBR, but have gear teeth on the flange circumference and radial and thrust bearings on the spline nut, all compactly integrated.

The rows of balls are held in a special resin retainer so that they smoothly roll and circulate. With this design, balls will not fall even if the spline shaft is removed.

### [No Angular Backlash]

The spline shaft has three crests positioned equidistantly at  $120^\circ$  and along both sides of each crest, two rows of balls (six rows in total) are arranged so as to hold the crest at a contact angle of  $45^\circ$  and provide a preload. As a result, backlash in the rotational direction is eliminated and the rigidity is increased.

### [Compact Design]

The spline nut is compactly integrated with radial and thrust bearings, allowing compact design to be achieved.

## Features of Each Model

### Rotary Ball Spline

#### [High Rigidity]

Since the contact angle is large and an appropriate preload is given, high rigidity against torque and moment is achieved.

Use of needle bearings in the support unit achieves a rigid nut support strong against a radial load.

#### [Optimal for Torque Transmission with Spline Nut Drive]

Since the support bearings allow a rigid nut support, these models are optimal for torque transmission with spline nut drive.

---

## Types and Features

---

### [Types of Spline Nuts]

#### Ball Spline with Gears Model LBG

Specification Table⇒B-396

These models are unit types based on model LBR, but have gear teeth on the flange circumference and radial and thrust bearings on the spline nut, all compactly integrated. It is optimal for a torque transmission mechanism with spline nut drive.

Without a thrust raceway

#### Ball Spline with Gears Model LBGT

Specification Table⇒B-398

These models are unit types based on model LBR, but have gear teeth on the flange circumference and radial and thrust bearings on the spline nut, all compactly integrated. It is optimal for a torque transmission mechanism with spline nut drive.

With a thrust raceway

# Rotary Ball Spline With Support Bearing Type

Models LTR and LTR-A

Fig.1 Structure of Rotary Ball Spline Model LTR

## Structure and Features

With the Rotary Ball Spline model LTR, the spline shaft has three crests on the circumference, and along both sides of each crest, two rows of balls (six rows in total) are arranged to hold the crest so that a reasonable preload is applied.

Angular-contact ball raceways are machined on the outer surface of the spline nut to constitute support bearings, allowing the whole body to be compactly and lightly designed.

The rows of balls are held in a special resin retainer so that they smoothly roll and circulate. With this design, balls will not fall even if the spline shaft is removed.

In addition, a dedicated seal for preventing foreign material from entering the support bearings is available.

### [No Angular Backlash]

Two rows of balls facing one another hold a crest, formed on the circumference of the spline nut, at a contact angle of  $20^\circ$  to provide a preload in an angular-contact structure. This eliminates an angular backlash in the rotational direction and increases the rigidity.

### [Compact Design]

The spline nut is integrated with the support bearings, allowing highly accurate, compact design to be achieved.

**Features of Each Model****Rotary Ball Spline****[Easy Installation]**

This ball spline can easily be installed by simply securing it to the housing using bolts.

**[High Rigidity]**

Since the contact angle is large and an appropriate preload is given, high rigidity against torque and moment is achieved.

The support bearing has a contact angle of  $30^\circ$  to secure high rigidity against a moment load, thus to achieve a rigid shaft support.

Model LTR-A, a compact type of LTR, has a contact angle of  $45^\circ$  .

Model LTR

Model LTR-A

For details, see B-408 to B-409.

## Checking List for Spline Shaft End Shape

If desiring a ball spline type with its end specially machined, check the following items when placing an order.

The diagram below shows a basic configuration of the Ball Spline.

### [Check Items]

- Type of the spline nut to be fit
- Number of spline nuts
- Clearance in the rotation direction
- Accuracy
- With/without a seal (for a single seal, check its orientation)
- Overall length (including all dimensions? Total value correct?)
- Effective spline length
- Hardened area (mark the location with symbol ☆ and indicate the purpose of hardening)
- Orientation of the flange (for flanged type)
- Spline shaft end shape (thicker than the minimum spline diameter?) (black, mill scale)
- Positional relationship between the spline nut and the spline shaft end shape (keyway of the spline nut, flange mounting hole)
- Indication of chamfering for each part
- Shape of chamfer on the spline shaft end (see B-382)
- Intended purpose of the though hole in the spline shaft if any
- o'. Snap ring groove
- p. Maximum length
- q. Precedented or not

# Housing Inner-diameter Tolerance

When fitting the spline nut with the housing, tight fitting is normally recommended. If the accuracy of the Ball Spline does not need to be very high, clearance fitting is also acceptable.

Table1 Housing Inner-diameter Tolerance

Housing Inner-diameter Tolerance	General conditions	H7
	When clearance needs to be small	J6

Note) For the housing inner-diameter tolerance of Rotary Ball Spline model LTR, H7 is recommended.

## Positions of the Spline-nut Keyway and Mounting Holes

The keyways formed on the outer surface of straight nuts for Ball Spline models are positioned where balls under a load are placed as shown in Fig.1.

The flange-mounting holes of the flange types are positioned as shown in Fig.2.

When placing an order, indicate their positions in relation to the keyway or the like to be formed on the spline shaft.

Fig.1 Positions of Keyways

Fig.2 Positions of Flange Mounting Holes

## Assembling the Ball Spline

### Mounting the Spline

Fig.1 and Fig.2 shows examples of mounting the spline nut. Although the Ball Spline does not require a large strength for securing it in the spline shaft direction, do not support the spline only with driving fitting.

Ball Spline

## Installing the Spline Nut

When installing the spline nut into the housing, do not hit the side plate or the seal, but gently insert it using a jig (Fig.3).

Fig.3

Table1 Dimensions of the Jig for Model LBS

Unit: mm

Nominal shaft diameter	15	20	25	30	40	50	60	70	85	100	120	150
di	12.5	16.1	20.3	24.4	32.4	40.1	47.8	55.9	69.3	83.8	103.8	131.8

Table2 Dimensions of the Jig for Model LT

Unit: mm

Nominal shaft diameter	6	8	10	13	16	20	25	30	40	50	60	80	100
di	5.0	7	8.5	11.5	14.5	18.5	23	28	37.5	46.5	56	75.5	94.5

## Installation of the Spline Shaft

When installing the spline shaft into the spline nut, identify the matching marks (Fig.4) on the spline shaft and the spline nut, and then insert the shaft straightforward while checking their relative positions.

Note that forcibly inserting the shaft may cause balls to fall off.

If the spline nut is attached with a seal or given a preload, apply a lubricant to the outer surface of the spline shaft.

Fig.4

## Options

## Ball Spline (Options)

### Lubrication

To prevent foreign material from entering the spline nut and the lubricant from leaking, special synthetic resin seals with high wear resistance are available for the Ball Spline.

Spline nuts with seals (seal for both ends type UU, and seal for one end) contain high-quality lithium-soap group grease No. 2. However, if using them at high speed or with a long stroke, replenish grease of the same type through the greasing hole on the spline nut after running in.

Afterward, replenish grease of the same type as necessary according to the service conditions.

The greasing interval differs depending on the conditions. Normally, replenish the lubricant (or replace the product) roughly every 100 km of travel distance (six months to one year) as a rule of thumb.

For a Ball Spline model type without a seal, apply grease to the interior of the spline nut or to the raceways of the spline shaft.

### Material and Surface Treatment

Depending on the service environment, the Ball Spline requires anticorrosive treatment or a different material. For details of anticorrosive treatment and material change, contact THK.

### Contamination Protection

Entrance of dust or other foreign material into the spline nut will cause abnormal wear or shorten the service life. Therefore, it is necessary to prevent detrimental foreign material from entering the Ball Spline. When entrance of dust or other foreign material is predicted, it is important to select an effective sealing device or dust-control device that meets the environment conditions.

For the Ball Spline, a special synthetic rubber seal that is highly resistant to wear is available as a contamination protection accessory. If desiring a higher contamination protection effect, a felt seal is also available for some types. For details about the felt seal, contact THK.

In addition, THK produces round bellows. Contact us for details.

Table1 Contamination protection accessory symbol

Symbol	Contamination protection accessory
No Symbol	Without seal
UU	Rubber seal attached on both ends of spline nut
U	Rubber seal attached on either end of spline nut
DD	Felt seal attached on both ends of spline nut
D	Felt seal attached on either end of spline nut
ZZ	Rubber seal attached on both ends of support bearings
Z	Rubber seal attached on either end of support bearings

## Specifications of the Bellows

Bellows are available as a contamination protection accessory. Use this specification sheet.

## Precautions on Use

## Ball Spline

### [Handling]

- (1) Disassembling components may cause dust to enter the system or degrade mounting accuracy of parts. Do not disassemble the product.
- (2) Tilting a spline nut or spline shaft may cause them to fall by their own weight.
- (3) Dropping or hitting the Ball Spline may damage it. Giving an impact to the product could also cause damage to its function even if the product looks intact.

### [Lubrication]

- (1) Thoroughly remove anti-rust oil and feed lubricant before using the product.
- (2) Do not mix lubricants of different physical properties.
- (3) In locations exposed to constant vibrations or in special environments such as clean rooms, vacuum and low/high temperature, normal lubricants may not be used. Contact THK for details.
- (4) When planning to use a special lubricant, contact THK before using it.
- (5) When adopting oil lubrication, the lubricant may not be distributed throughout the product depending on the mounting orientation of the system. Contact THK for details.
- (6) Lubrication interval varies according to the conditions. Contact THK for details.

### [Precautions on Use]

- (1) Entrance of foreign material may cause damage to the ball circulating component or functional loss. Prevent foreign material, such as dust or cutting chips, from entering the system.
- (2) Contact THK if you desire to use the product at a temperature of 80°C or higher.
- (3) When planning to use the product in an environment where the coolant penetrates the spline nut, it may cause trouble to product functions depending on the type of the coolant. Contact THK for details.
- (4) If foreign material adheres to the product, replenish the lubricant after cleaning the product.
- (5) When using the product in locations exposed to constant vibrations or in special environments such as clean rooms, vacuum and low/high temperature, contact THK in advance.
- (6) Do not remove the spline nut from the spline shaft unnecessarily. If you inevitably reassemble the product, check the relative positions of the spline nut and the spline shaft by identifying the matching marks on them. Be sure not to twist the spline nut and the spline shaft when inserting the shaft into the nut. Forcibly inserting it may cause balls to fall. For a type equipped with seals, apply a lubricant to the circumference of the shaft.
- (7) When installing the spline shaft into the housing, do not hit the seal section or the stop ring section. Doing so may cause malfunction.
- (8) Giving a shock to the product may cause a functional loss. Do not drop the product or hit it with a tool.
- (9) Take care not to let the spline nut run on the incomplete spline section. Doing so may cause malfunction.

**[Storage]**

When storing the Ball Spline, enclose it in a package designated by THK and store it in a horizontal orientation while avoiding high temperature, low temperature and high humidity. If the product is stored in an inappropriate position, the spline shaft could bend.

**[Other]**

If you have any trouble or question when handling the product, contact THK.

## Features of the Spline Nut

### Structure and Features

Spline Nut models DPM and DP are low price bearings that are made of a special alloy (see A-515) formed by die casting and use highly accurate spline shafts as the core. Unlike conventional machined spline nuts, the sliding surface of these models maintains a chill layer formed in the rolling process, thus achieving high wear resistance.

The surface of the spline shafts to be used in combination with the nuts is hardened through rolling and is mirror-finished. Accordingly, smooth sliding motion is achieved.

The specially designed teeth of the spline have large contact areas, as well as concentricity, which enable the shaft to automatically establish the center as a torque is applied. Therefore, the teeth demonstrate stable performance in transmitting a torque.

## Features of the Special Rolled Shafts

Dedicated rolled shafts with standardized lengths are available for the Spline Nut.

### [Increased Wear Resistance]

The shaft teeth are formed by cold gear rolling, and the surface of the tooth surface is hardened to over 250 HV and mirror-finished. As a result, the shafts are highly wear resistant and achieve significantly smooth motion when used in combination with nuts.

### [Improved Mechanical Properties]

Inside the teeth of the rolled shaft, a fiber flow occurs along the contour of the tooth surface of the shaft, making the structure around the teeth roots dense. As a result, the fatigue strength is increased.

### [Additional Machining of the Shaft End Support]

Since each shaft is rolled, additional machining of the support bearing of the shaft end can easily be performed by lathing or milling.

## High Strength Zinc Alloy

The high strength zinc alloy used in the spline nuts is a material that is highly resistant to seizure and wear and has a high load carrying capacity. Its composition, mechanical properties, physical properties and wear resistance are given below.

### [Composition]

Table1 Composition of the High Strength Zinc Alloy  
Unit: %

Item	Description

## Selecting a Spline Nut

### [Dynamic Permissible Torque T and Dynamic Permissible Thrust F]

The dynamic permissible torque (T) and the dynamic permissible thrust (F) are the torque and the thrust at which the contact surface pressure on the tooth surface of the bearing is 9.8 N/mm<sup>2</sup>. These values are used as a measuring stick for the strength of the spline nut.

### [pV Value]

With a sliding bearing, a pV value, which is the product of the contact surface pressure (p) and the sliding speed (V), is used as a measuring stick to judge whether the assumed model can be used. Use the corresponding pV value indicated in Fig.1 as a guide for selecting a spline nut. The pV value also varies according to the lubrication conditions.

Fig.1 pV Value

Table1 Safety Factor ( $f_s$ )

Type of load	Lower limit of $f_s$
For a static load less frequently used	1 to 2
For an ordinary single-directional load	2 to 3
For a load accompanied by vibrations/impact	4 or greater

### ● $f_s$ : Safety Factor

To calculate a load applied to the spline nut, it is necessary to accurately obtain the effect of the inertia that changes with the weight and dynamic speed of an object. In general, with reciprocating or rotating machines, it is not easy to accurately obtain all the factors such as the effect of the start and stop, which are always repeated. Therefore, if the actual load cannot be obtained, it is necessary to select a bearing while taking into account the empirically obtained safety factors ( $f_s$ ) shown in Table1.

● **f<sub>r</sub>:Temperature Factor**

If the temperature of the spline nut exceeds the normal temperature range, the seizure resistance of the nut and the strength of the material will decrease. Therefore, it is necessary to multiply the dynamic permissible torque (T) and the dynamic permissible thrust (F) by the corresponding temperature factor indicated in Fig.2.

Accordingly, when selecting a spline nut, the following equations need to be met in terms of its strength.

Dynamic permissible torque (T)

$$f_s \leq \frac{f_r \cdot T}{P_T}$$

Static permissible thrust (F)

$$f_s \leq \frac{f_r \cdot F}{P_F}$$

- f<sub>s</sub> : Static safety factor (see Table1 on A-517)
- f<sub>r</sub> : Temperature factor (see Fig.2)
- T : Dynamic permissible torque (N-m)
- P<sub>T</sub> : Applied torque (N-m)
- F : Dynamic permissible thrust (N)
- P<sub>F</sub> : Axial load (N)

● **Hardness of the Surface and Wear Resistance**

The hardness of the shaft significantly affects the wear resistance of the spline nut. If the hardness is equal to or less than 250 HV, the abrasion loss increases as indicated in Fig.3. The roughness of the surface should preferably be 0.80a or less.

A specially rolled shaft achieves surface hardness of 250 HV or greater, through hardening as a result of rolling, and a surface roughness of 0.20a or less. Thus, the dedicated rolled shaft is highly wear resistant.

Fig.2 Temperature factor

Fig.3 Hardness of the Surface and Wear Resistance

[Calculating the Contact Surface Pressure p]

$$p = \frac{P_T}{T} \times 9.8$$

- p : Contact surface pressure on the tooth under a load torque (P<sub>T</sub>) (N/mm<sup>2</sup>)
- T : Dynamic permissible torque (N-m)
- P<sub>T</sub> : Applied torque (N-m)

**[Calculating the Sliding Speed]**

With splines, the sliding speed of the tooth surface is equal to the feeding speed.

$V$  : Sliding speed of the tooth (m/min)

**[Example of calculation]**

Use Spline Nut DPM and reciprocate it at a speed in the axial direction of 5 m/min while transmitting a load torque of 78 N·m. Since the applied torque is not consistent in direction, it is important to select a spline nut that can be used in locations accompanied by vibrations and impact.

First, select a nut that has a dynamic permissible torque ( $T$ ) at which it can be used.

$$T \geq \frac{f_s \cdot P_T}{f_T} = \frac{4 \times 78}{1} = 312 \text{ N} \cdot \text{m}$$

Safety factor ( $f_s$ ) = 4

Temperature factor ( $f_T$ ) = 1

Applied torque ( $P_T$ ) = 78 N·m

Select Spline Nut model DPM3560 (dynamic permissible torque  $T = 443$  N·m), which satisfies the dynamic permissible torque ( $T$ ) above.

Obtain the pV value.

Obtain the contact surface pressure ( $p$ ).

$$p = \frac{P_T}{T} \times 9.8 = \frac{78}{443} \times 9.8 \doteq 1.73 \text{ N/mm}^2$$

Obtain the sliding speed ( $V$ ).

$$V = 5 \text{ m/min}$$

From the diagram of pV values (see Fig.1 on A-517), it is judged that there will be no abnormal wear if the sliding speed ( $V$ ) is 13.5 m/min or below against the "p" value of 1.73 N/mm<sup>2</sup>. Therefore, it is appropriate to select model DPM3560.

## Fit

For the fitting between the spline nut circumference and the housing, we recommend loose fitting or tight fitting.

Housing inner-diameter tolerance: H8 or J8

## Installation

### [About Chamfer of the Housing's Mouth]

To increase the strength of the root of the flange of the spline nut, the corner is machined to have an R shape. Therefore, it is necessary to chamfer the inner edge of the housing's mouth.

Table1 Chamfer of the Housing's Mouth

30	
35	3
40	
45	
50	

## Lubrication

Select a lubrication method according to the conditions of the spline nut.

### [Oil Lubrication]

For the lubrication of the spline nut, oil lubrication is recommended. Specifically, oil-bath lubrication or drop lubrication is particularly effective. Oil-bath lubrication is the most appropriate method since it meets harsh conditions such as high speed, heavy load or external heat transmission, and it cools the spline nut. Drop lubrication suits low to medium speed and a light to medium load. Select a lubricant according to the conditions as indicated in Table2.

Table2 Selection of a Lubricant

Condition	Types of Lubricants
Low speed, high load, high temperature	High-viscosity sliding surface oil or turbine oil
Low speed, light load, low temperature	Low-viscosity sliding surface oil or turbine oil

### [Grease Lubrication]

In low-speed feed, which occurs less frequently, the user can lubricate the slide system by manually applying grease to the shaft on a regular basis or using the greasing hole on the spline nut. We recommend using lithium-soap group grease No. 2.

## Features of the Linear Bushing

Fig.1 Structure of Linear Bushing Model LM···UU

### Structure and Features

Linear Bushing model LM is a linear motion system used in combination with a cylindrical LM shaft to perform infinite straight motion. The balls in the loaded area of the nut are in point contact with the LM shaft. This allows straight motion with minimal friction resistance and achieves highly accurate and smooth motion despite the small permissible load.

The nut uses high-carbon chromium bearing steel and its outer and inner surfaces are ground after being heat-treated.

The Linear Bushing is used in a broad array of applications, such as slide units of precision equipment including OA equipment and peripherals, measuring instruments, automatic recorders and digital 3D measuring instruments, industrial machines including multi-spindle drilling machine, punching press, tool grinder, automatic gas cutting apparatus, printing machine, card selector and food packing machine.

## Features and Types

### Features of the Linear Bushing

#### [Interchangeability]

Since the dimensional tolerances of the Linear Bush's components are standardized, they are interchangeable. The LM shaft is machined through cylindrical grinding, which can easily be performed, and it allows highly accurate fitting clearance to be achieved.

#### [Highly Accurate Retainer Plate]

Since the retainer, which guides three to eight rows of balls, is integrally molded, it is capable of accurately guiding the balls in the traveling direction and achieving stable running accuracy.

Small-diameter types use integrally molded retainers made of synthetic resin. It reduces noise generated during operation and allows for superb lubrication.

#### [Wide Array of Types]

A wide array of types are available, such as standard type, clearance-adjustable type, open type, long type and flanged linear bushing, allowing the user to select a type that meets the intended use.

---

## Dedicated Shafts for Model LM

---

The LM shaft of the Linear Bushing needs to be manufactured with much consideration for hardness, surface roughness and dimensional accuracy of the shaft since balls roll directly on it. THK manufactures dedicated LM shafts for the Linear Bushing.

---

## Standard LM Shafts

---

THK manufactures high quality, dedicated LM shafts for Linear Bushing model LM series.

---

## Specialy Machined Types

---

THK also supports special machining processes such as tapping, milling, threading, through hole and joggling, as shown in the Fig.2, at your request.

Fig.2

120	LM 120-AJ	8	14900	LM 120-OP	6	11600

Note) The numbers of ball rows in the table apply to types using a resin retainer. Those of types using a metal retainer are indicated in parentheses.

# Linear Bushing Types

## Types and Features

### Standard Type

With the Linear Bushing nut having the most accurate cylindrical shape, this type is widely used.

There are two series of the Linear Bushing in dimensional group.

- Model LM  
Metric units series used most widely in Japan
- Model LM-MG  
Stainless steel version of type LM
- Model LME  
Metric units series commonly used in Europe

Standard Type

### Open Type

The nut is partially cut open by one row of balls (50° to 80°). This enables the Linear Bushing to be used even in locations where the LM shaft is supported by a column or fulcrum. In addition, a clearance can easily be adjusted.

Models LM-OP/LME-OP

Model LM-MG-OP

Open Type

## Clearance-adjustable Type

This type has the same dimensions as the standard type, but the nut has a slit in the direction of the LM shaft. This allows the linear bushing to be installed in a housing whose inner diameter is adjustable, and enables the clearance between the LM shaft and the housing to easily be adjusted.

Models LM-AJ/LME-AJ

Model LM-MG-AJ

Clearance-adjustable Type

## Long Type

Containing two units of the standard retainer plate, this type is optimal for locations where a moment load is present and reduces man-hours in installation.

Model LM-L…………Standard type

Long Type

## Flanged Type (Round)

The nut of the standard type Linear Bushing is integrated with a flange. This enables the Linear Bushing to be directly mounted onto the housing with bolts, thus achieving easy installation.

Model LMF…………Standard type

Model LMF-M…………Made of stainless steel

Flanged Type (Round)

---

## Flanged Type (Square)

Like model LMF, this type also has a flange, but the flange is cut to a square shape. Since the height is lower than the circular flange type, compact design is allowed.

Model LMK··········Standard type

Model LMK-M··········Made of stainless steel

Flanged Type (Square)

---

## Flanged Type (Round) - Long

The nut of the long type Linear Bushing is integrated with a flange. This enables the Linear Bushing to be directly mounted onto the housing with bolts, thus achieving easy installation. Containing two units of the standard retainer plate, this type is optimal for locations where a moment load is present.

Model LMF-L··········Standard type

Model LMF-ML··········Made of stainless steel

Flanged Type (Round) - Long

---

## Flanged Type (Square) - Long

Like model LMF-L, this type also has a flange, but the flange is cut to a square shape. Since the height is lower than the circular flange type, compact design is allowed.

Model LMK-L··········Standard type

Model LMK-ML··········Made of stainless steel

Flanged Type (Square) - Long

## Flanged Type (Cut Flange)

The nut is integrated with a cut flange. Since the height is lower than model LMK, compact design is allowed. Since the rows of balls in the Linear Bushing are arranged so that two rows receive the load from the flat side, a long service life can be achieved.

Model LMH······Standard type

Flanged Type (Cut Flange)

## Flanged Type (Cut Flange) - Long

The flange is a cut flange and lower than model LMK-L, allowing compact design. Containing two units of the standard retainer plate, this type is optimal for locations where a moment load is present. Since the rows of balls in the Linear Bushing are arranged so that two rows receive the load from the flat side, a long service life can be achieved.

Model LMH-L······Standard type

Flanged Type (Cut Flange) - Long

## Linear Bushing Model SC

It is a case unit where the standard type of Linear Bushing is incorporated into a small, light-weight aluminum casing. This model can easily be mounted simply by securing it to the table with bolts.

Linear Bushing Model SC

---

## Linear Bushing (Long) Model SL

A long version of model SC, this model contains two units of the standard type Linear Bushing in an aluminum casing.

Linear Bushing (Long) Model SL

---

## Linear Bushing Model SH

It is a case unit where the standard type of Linear Bushing is incorporated into a smaller and lighter aluminum casing than model SC. This model allows even more compact design than model SC. It also has flexibility in mounting orientation. Additionally, it is structured so that two rows of balls receive the load from the top of the casing, allowing a long service life to be achieved.

Linear Bushing Model SH

---

## Linear Bushing (Long) Model SH-L

A long version of model SH, this model is a case unit that contains two units of the standard type Linear Bushing in an aluminum casing.

Linear Bushing (Long) Model SH-L

## LM Shaft End Support Model SK

An aluminum-made light fulcrum for securing an LM shaft. The LM shaft mounting section has a slit, enabling the linear bushing to firmly secure an LM shaft using bolts.

LM Shaft End Support Model SK

## Standard LM Shafts

THK manufactures high quality, dedicated LM shafts for Linear Bushing model LM series.

Standard LM Shafts

## Build-to-order LM Shafts

THK also manufactures hollow LM shafts and specially machined shafts at your request.

# Flowchart for Selecting a Linear Bushing

## Steps for Selecting a Linear Bushing

The following flowchart should be used as a guide for selecting a Linear Bushing.

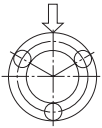

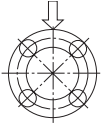

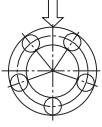

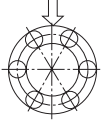

## Rated Load and Nominal Life

### [Load Rating]

The rated load of the Linear Bushing varies according to the position of balls in relation to the load direction. The basic load ratings indicated in the specification tables each indicate the value when one row of balls receiving a load are directly under the load.

If the Linear Bushing is mounted so that two rows of balls evenly receive the load in the load direction, the rated load changes as shown in table 1.

Table 1

Rows of balls	Ball position	Load Rating
3 rows		$1 \times C$
4 rows		$1.41 \times C$
5 rows		$1.46 \times C$
6 rows		$1.28 \times C$

Linear Bushing

For specific values for "C" above, see the respective specification table.

**[Calculating the Nominal Life]**

The nominal life of the Linear Bushing is obtained using the following equation.

$$L = \left( \frac{f_H \cdot f_T \cdot f_C}{f_W} \cdot \frac{C}{P_C} \right)^3 \times 50$$

- L : Nominal life (km)
- C : Basic dynamic load rating (N)
- P<sub>C</sub> : Calculated load (N)
- f<sub>T</sub> : Temperature factor (see Fig.2 on A-539)
- f<sub>C</sub> : Contact factor (see Table2 on A-539)
- f<sub>W</sub> : Load factor (see Table3 on A-539)
- f<sub>H</sub> : Hardness factor (see Fig.1)

**● When a Moment Load is Applied to a Single Nut or Two Nuts in Close Contact with Each Other**

When a moment load is applied to a single nut or two nuts in close contact with each other, calculate the equivalent radial load at the time the moment is applied.

$$P_u = K \cdot M$$

- P<sub>u</sub> : Equivalent radial load (N)  
(with a moment applied)
- K : Equivalent factors  
(see Table4 to Table6 on A-540)
- M : Applied moment (N-mm)

However, "P<sub>u</sub>" is assumed to be within the basic static load rating (C<sub>0</sub>).

**● When a Moment Load and a Radial Load are Simultaneously Applied**

When a moment and a radial load are applied simultaneously, calculate the service life based on the sum of the radial load and the equivalent radial load.

**■f<sub>H</sub>: Hardness Factor**

To maximize the load capacity of the Linear Bushing, the hardness of the raceways needs to be between 58 to 64 HRC.

If the hardness is lower than this range, the basic dynamic load rating and the basic static load rating decrease. Therefore, it is necessary to multiply each rating by the respective hardness factor (f<sub>H</sub>).

Normally, f<sub>H</sub>=1.0 since the Linear Bushing has sufficient hardness.

Fig.1 Hardness Factor (f<sub>H</sub>)

**■f<sub>r</sub>: Temperature Factor**

If the temperature of the environment surrounding the operating Linear Bushing exceeds 100°C , take into account the adverse effect of the high temperature and multiply the basic load ratings by the temperature factor indicated in Fig.2.

Also note that the Linear Bushing itself must be of high temperature type.

Note) If the environment temperature exceeds 80 °C , use a Linear Bushing type equipped with metal retainer plates.

Fig.2 Temperature Factor (f<sub>r</sub>)

**■f<sub>c</sub>: Contact Factor**

When multiple nuts are used in close contact with each other, their linear motion is affected by moments and mounting accuracy, making it difficult to achieve uniform load distribution. In such applications, multiply the basic load rating (C) and (C<sub>0</sub>) by the corresponding contact factor in Table2.

Note) If uneven load distribution is expected in a large machine, take into account the respective contact factor indicated in Table2.

Table2 Contact Factor (f<sub>c</sub>)

Number of nuts in close contact with each other	Contact factor f <sub>c</sub>
2	0.81
3	0.72
4	0.66
5	0.61
Normal use	1

**■f<sub>w</sub>: Load Factor**

In general, reciprocating machines tend to involve vibrations or impact during operation. It is difficult to accurately determine vibrations generated during high-speed operation and impact during frequent start and stop motion. Therefore, when loads applied on a Linear Bushing cannot be measured, or when speed and impact have a significant influence, divide the basic load rating (C or C<sub>0</sub>), by the corresponding load factor in Table3.

Table3 Load Factor (f<sub>w</sub>)

Vibrations/ impact	Speed(V)	f <sub>w</sub>
Faint	Very low V ≤ 0.25m/s	1 to 1.2
Weak	Slow 0.25 < V ≤ 1m/s	1.2 to 1.5
Medium	Medium 1 < V ≤ 2m/s	1.5 to 2
Strong	High V > 2m/s	2 to 3.5

**[Calculating the Service Life Time]**

When the nominal life (L) has been obtained, if the stroke length and the number of reciprocations per minute are constant, the service life time is obtained using the following equation.

$$L_h = \frac{L \times 10^3}{2 \times l_s \times n_1 \times 60}$$

- L<sub>h</sub> : Service life time (h)
- l<sub>s</sub> : Stroke length (m)
- n<sub>1</sub> : Number of reciprocations per minute (min<sup>-1</sup>)

## Table of Equivalent Factors

## Accuracy Standards

The accuracy of the Linear Bushing in inscribed bore diameter, outer diameter, width and eccentricity is described in the corresponding specification table. The accuracy of mode LM in inscribed bore diameter and eccentricity is classified into high accuracy grade (no symbol) and precision grade (P). (Accuracy symbol is expressed at the end of the model number.)

The accuracy of clearance-adjustable types (-AJ) and open types (-OP) in inscribed bore diameter and outer diameter indicates the value before division.

## Assembling the Linear Bushing

### [Inner Diameter of the Housing]

Table1 shows recommended housing inner-diameter tolerance for the Linear Bushing. When fitting the Linear Bushing with the housing, loose fit is normally recommended. If the clearance needs to be smaller, provide transition fit.

Table1 Housing Inner-diameter Tolerance

Type		Housing	
Model No.	Accuracy	Loose fit	Transition fit
LM	High accuracy grade (no symbol)	H7	J7
	Precision Grade (P)	H6	J6
LME	—	H7	K6, J6
LMF	High accuracy grade (no symbol)	H7	J7
LMK			
LMH			
LM-L			
LMF-L			
LMK-L			
LMH-L			

### [Clearance between the Nut and the LM Shaft]

When using the Linear Bushing in combination with an LM shaft, use normal clearance in ordinary use and small gap if the clearance is to be minimized.

Note1) If the clearance after installation is to be negative, it is preferable not to exceed the radial clearance tolerance indicated in the specification table.

Note2) The shaft tolerance for Linear Bushing models SC, SL SH and SH-L falls under high accuracy grade (no symbol).

Table2 Shaft Outer-diameter Tolerance

Type		LM Shaft	
Model No.	Accuracy	Normal clearance	Small gap
LM	High accuracy grade (no symbol)	f6, g6	h6
	Precision Grade (P)	f5, g5	h5

**[Mounting the Nut]**

Although the Linear Bushing does not require a large amount of strength for securing it in the axial direction, do not rely only on a press fit to support the nut. For the housing inner-diameter tolerance, see Table1 on A-542.

**● Installing the Standard Type**

Fig.1 and Fig.2 show examples of installing the standard type Linear Bushing.

When securing the Linear Bushing, use snap rings or stopper plates.

Fig.1 Snap Ring

Fig.2 Stopper Plate

### ■Snap Ring for Installation

To secure Linear Bushing model LM, snap rings indicated in Table3 are available.

Note1) For models indicated with parentheses, use C-shape concentric snap rings.

Note2) The Table3 commonly applies to models LM, LM-GA, LM-MG and LM-L.

Table3 Types of Snap Rings

Model No.	Snap ring			
	For outer surface		For inner surface	
	Needle snap ring	C-shape snap ring	Needle snap ring	C-shape snap ring
LM 3	—	—	AR 7	—
LM 4	—	—	8	—

LM 120A	—	(180)	180	—

### ■Set Screws Not Allowed

Securing the nut by pressing the outer surface with one set screw as shown in Fig.3 will cause the nut to be deformed.

Fig.3

### ● Installing a Flanged Type

With models LMF, LMK and LMH, the nut is integrated with a flange. Therefore, the Linear Bushing can be mounted only via the flange.

Nut mounted via socket and spigot joint

Mounted via a flange only

### ● Installing a Clearance-adjustable Type

To adjust the clearance of a clearance-adjustable type (-AJ), use a housing that allows adjustment of the nut outer diameter so as to facilitate the adjustment of the clearance between the Linear Bushing and the LM shaft. Positioning the slit of the Linear Bushing at an angle of  $90^\circ$  with the housing's slit will provide uniform deformation in the circumferential direction. (See Fig.4.)

Fig.4

### ● Mounting an Open Type

For an open type (-OP), also use a housing that allows adjustment of the nut outer diameter as shown in Fig.5.

Open types are normally used with a light pre-load. Be sure not to give an excessive preload.

Fig.5

### [Mounting the Shaft End Support]

Shaft end support model SK can easily be secured to the table using mounting bolts. Model SK enables the LM shaft to firmly be secured using tightening bolts.

### [Installing an LM Case Unit]

#### ● Attaching Model SC (SL)

Since models SC and SL can be attached from the top or bottom by simply tightening it using bolts, the installation time can be shortened.

(See Fig.6.)

Fig.6

#### ● Attaching Model SH (SH-L)

Since models SH and SH-L can be attached from the top or bottom by simply tightening it using bolts, the installation time can be shortened. (See Fig.7.)

Fig.7

## Point of Design

### Assembling the Linear Bushing

#### [Incorporating the Nut]

When incorporating the standard Linear Bushing into a housing, use a jig and drive in the nut, or use a flatter plate and gently hit the nut, instead of directly hitting the side plate or the seal. (See Fig.8.)

Fig.8

#### [Inserting the LM Shaft]

When inserting the LM shaft into the Linear Bushing, align the center of the shaft with that of the nut and gently insert the shaft straightforward into the nut. If the shaft is slanted while it is inserted, balls may fall off or the retainer may be deformed. (See Fig.9.)

Fig.9

#### [When Under a Moment Load]

When using the Linear Bushing, make sure the load is evenly distributed on the whole ball raceway. In particular, if a moment load is applied, use two or more Linear Bushing units on the same LM shaft and secure an adequately large distance between the units.

If using the Linear Bushing under a moment load, also calculate the equivalent radial load and identify the correct model number. (See A-538.)

#### [Rotational Use Not Allowed]

The Linear Bushing is not suitable for rotational use for a structural reason. (See Fig.10.)

Forcibly rotating it may cause an unexpected accident.

Fig.10

### [Precautions on Installing an Open Three-ball-row Type Linear Bushing]

When installing an open three-ball-row type Linear Bushing, mount it while taking into account the load distribution as indicated in Fig.11.

Fig.11

### [Attaching Felt Seal Model FLM]

The felt seal can be press-fit into a housing finished to H7, but cannot be used as a stopper for preventing the Linear Bushing from coming off. Be sure to use the felt seal by attaching it as indicated in the Fig.12.

Also make sure to impregnate the felt with sufficient lubricant before attaching it.

Fig.12

## Options

## Linear Bushing (Options)

### Lubrication

The Linear Bushing requires grease or oil as a lubricant for its operation.

#### [Grease Lubrication]

When installing a type attached with seals on both sides (···UU) to the LM shaft, apply grease to rows of balls in the Linear Bushing.

When installing standard types (without seal), perform the same as above or apply grease to the LM shaft.

Afterward, replenish grease of the same type as necessary according to the service conditions.

We recommend using high-quality lithium-soap group grease No. 2.

#### [Oil Lubrication]

Turbine oil, machine oil and spindle oil are commonly used as a lubricant.

When oiling the Linear Bushing, drop oil on the LM shaft, or infuse it from the greasing hole on the housing as shown in Fig.1.

### Material and Surface Treatment

For the Linear Bushing and the LM shaft, highly corrosion-resistant stainless steel types are available for some models.

Although the LM shaft can be surface treated, some types may not be suitable for the treatment. Contact THK for details.

## Contamination Protection

Entrance of dust or other foreign material into the Linear Bushing will cause abnormal wear or shorten the service life. When nut contamination is expected, it is important to select an effective sealing device or dust-control device that meets the environment conditions.

For the Linear Bushing, a special synthetic rubber seal that is highly resistant to wear and a felt seal (highly dust preventive with low seal resistance) are available as contamination protection accessories.

In addition, THK produces round bellows. Contact us for details.

# Felt Seal Model FLM

● For detailed dimensions, see B-461.

Linear Bushing model LM series include types equipped with a special synthetic rubber seal (LM... UU, U). If desiring to have an additional contamination protection measure, or desiring to lower the seal resistance, use the felt seal model FLM.

## Precautions on Use

## Linear Bushing

### [Handling]

- (1) Disassembling components may cause dust to enter the system or degrade mounting accuracy of parts. Do not disassemble the product.
- (2) Dropping or hitting the Linear Bushing may damage it. Giving an impact force to the bushing could also cause damage even if the product looks intact.

### [Lubrication]

- (1) Thoroughly remove anti-rust oil and feed lubricant before using the product.
- (2) Do not mix lubricants of different physical properties.
- (3) In locations exposed to constant vibrations or in special environments such as clean rooms, vacuum and low/high temperature, normal lubricants may not be used. Contact THK for details.
- (4) When planning to use a special lubricant, contact THK before using it.

### [Precautions on Use]

- (1) Entrance of foreign material may cause damage to the ball circulating component or functional loss. Prevent foreign material, such as dust or cutting chips, from entering the system.
- (2) Do not use the product at temperature of 80 °C or higher. Contact THK if you desire to use the product at a temperature of 80°C or higher.
- (3) Please be careful when using the product in an environment with excessive coolant. The coolant may cause premature failure if it penetrates the bushing nut. Contact THK for further details.
- (4) If foreign material adheres to the product, replenish the lubricant after cleaning the product.
- (5) When using the product in locations exposed to constant vibrations or in special environments such as clean rooms, vacuum and low/high temperature, contact THK in advance.

### [Storage]

When storing the Linear Bushing, enclose it in a package designated by THK and store it while avoiding high temperature, low temperature and high humidity.

# LM Stroke

## Models ST, ST-B and STI

Fig.1 Structure of LM Stroke Model ST

## Structure and Features

Model ST has a ball cage and balls both incorporated into a precision-ground cylindrical nut as shown in Fig.1. The balls are arranged in zigzags so as to evenly receive a load. The ball cage is a drilled cage made of a light alloy with high rigidity, and is capable of high-speed motion. A thrust ring and a snap ring are installed on both sides of the inner surface of the nut to prevent the ball cage from overshooting.

This structure allows rotational motion, reciprocal motion and complex motion with a small friction coefficient. Model ST has a stroke length up to twice the range within which the ball cage can travel. Since high accuracy can be obtained at a low price, this model is used in a broad array of applications such as press die setting, ink roll unit of printing machine, workpiece chuck unit of punching press, press feeder, work head of electric discharge machine, wound roll corrector, spinning and weaving machine, distortion measuring equipment, spindle of optical measuring instrument, and photocopiers.

## Features of Each Model

LM Stroke

### [Minimal Friction Coefficient]

The balls and the ball raceway are in point contact, which causes the smallest rolling loss, and the balls are individually retained in the ball cage. This allows the LM stroke to perform rolling motion at a minimal friction coefficient ( $\mu=0.0006$  to  $0.0012$ ).

### [Compact Design]

Since it consists only of a thin nut and balls, the outer diameter of the bearing is minimized and a light, space-saving, compact design is achieved.

### [High Accuracy at a Low Price]

A highly accurate slide unit can be produced at a low price.

## Types and Features

### Light Load Type Model ST

Specification Table⇒B-464

Model ST is a light load type that allows for a long stroke.

Shaft diameter:  $\phi 6$  to  $\phi 100$

In addition, a type attached with seal is available. Model ST-UU

Model ST

### Medium Load Type Model ST-B

Specification Table⇒B-464

It has the same dimensions as model ST, but has a shorter stroke and achieves a rated load twice that of ST.

Shaft diameter:  $\phi 8$  to  $\phi 100$

In addition, a type attached with seal is available. Model ST-UUB

Model ST-B

### Inner Ring Type Model STI

If the LM shaft cannot be hard quenched, STI allows an inner ring to be incorporated. The inner ring is available build-to-order.

Model STI

LM Stroke

## Rated Load and Nominal Life

### [Load Rating]

The basic load ratings for model ST are indicated in the respective specification tables.

### [Nominal Life]

The nominal life of model ST is obtained using the following equation.

$$L = \left( \frac{f_H \cdot f_T \cdot f_C}{f_W} \cdot \frac{C}{P_C} \right)^3$$

- L : Nominal life (rotating  $10^6$  times)  
 (The total number of revolutions that 90% of a group of identical LM strokes independently operating under the same conditions can achieve without showing flaking)
- C : Basic dynamic load rating (kN)
- $P_C$  : Calculated radial load (kN)
- $f_H$  : Hardness factor (see Fig.2 on A-557)
- $f_T$  : Temperature factor (see Fig.3 on A-557)
- $f_C$  : Contact factor (see Table1 on A-558)
- $f_W$  : Load factor (see Table2 on A-558)

### [Calculating the Service Life Time]

When the nominal life (L) has been obtained, if the number of revolutions per minute and the number of reciprocations per minute are constant, the service life time is obtained using the following equation.

#### ● For Rotating Motion or Complex Motion

$$L_h = \frac{10^6 \times L}{60 \sqrt{(dm \cdot n)^2 + (10 \times \alpha \cdot l_s \cdot n_1)^2} / dm}$$

#### ● For Reciprocating Motion

$$L_h = \frac{10^6 \times L}{60 \times 10 \times \alpha \cdot l_s \cdot n_1 / (\pi \cdot dm)}$$

- $L_h$  : Service life time (h)
- n : Revolutions per minute ( $\text{min}^{-1}$ )
- $n_1$  : Number of reciprocations per minute ( $\text{min}^{-1}$ )
- $l_s$  : Stroke length (mm)
- dm : Pitch circle diameter (mm)  
 $(dm \approx 1.15 \times dr)$
- dr : Ball inscribed bore diameter (mm)
- $\alpha$  : Factor for cage material ( $\alpha=0.7$ )

## Features of Each Model

## LM Stroke

**[Tolerance Value in Rotation and Reciprocating Speed]**

The permissible speed limit of model ST is obtained using the following equation.

$$DN \geq dm \cdot n + 10 \times l_s \cdot n_1$$

For the DN value above, the following value applies as a standard value.

For oil lubrication DN=600000

For grease lubrication DN=300000

However, the following points must be taken into account.

$$n_1 \leq 5000$$

$$l_s \cdot n_1 \leq 50000$$

● **f<sub>H</sub>: Hardness Factor**

To maximize the load capacity of model ST, the hardness of the raceways needs to be between 58 to 64 HRC.

If the hardness is lower than this range, the basic dynamic load rating and the basic static load rating decrease. Therefore, it is necessary to multiply each rating by the respective hardness factor (f<sub>H</sub>).

Normally, f<sub>H</sub>=1.0 since model ST has sufficient hardness.

Fig.2 Hardness Factor (f<sub>H</sub>)

● **f<sub>T</sub>: Temperature Factor**

If the temperature of the environment surrounding the operating model ST exceeds 100°C, take into account the adverse effect of the high temperature and multiply the basic load ratings by the temperature factor indicated in Fig.3.

(Note) If the environment temperature exceeds 80°C, contact THK.

Fig.3 Temperature Factor (f<sub>T</sub>)

● **f<sub>c</sub>: Contact Factor**

When multiple nuts of model ST are used in close contact with each other, their linear motion is affected by moments and mounting accuracy, making it difficult to achieve uniform load distribution. In such applications, multiply the basic load rating (C) and (C<sub>0</sub>) by the corresponding contact factor in Table1.

Note) If uneven load distribution is expected in a large machine, take into account the respective contact factor indicated in table 1.

Table1 Contact Factor (f<sub>c</sub>)

Number of nuts in close contact with each other	Contact factor f <sub>c</sub>
2	0.81
3	0.72
4	0.66
5	0.61
Normal use	1

● **f<sub>w</sub>: Load Factor**

In general, reciprocating machines tend to involve vibrations or impact during operation. It is extremely difficult to accurately determine vibrations generated during high-speed operation and impact during frequent start and stop. Therefore, when speed and vibrations have a significant influence, divide the basic dynamic load rating (C or C<sub>0</sub>), by the corresponding load factor in Table2 of empirically obtained data.

Table2 Load Factor (f<sub>w</sub>)

Vibrations/ impact	Speed(V)	f <sub>w</sub>
Faint	Very low V ≤ 0.25m/s	1 to 1.2
Weak	Slow 0.25 < V ≤ 1m/s	1.2 to 1.5
Medium	Medium 1 < V ≤ 2m/s	1.5 to 2
Strong	High V > 2m/s	2 to 3.5

## Accuracy Standards

The tolerance value in inscribed bore diameter (dr), nut outer diameter (D) and nut length (L) is indicated in the corresponding specification table.

The end of the nut may be deformed due to tension of the snap ring. Therefore, when measuring the nut outer diameter, it is necessary to calculate the measurement range using the following equation, and obtain the average diameter value within the range.

The tolerance value in the nut outer diameter is equal to the calculated average value of the maximum diameter and the minimum diameter obtained through two-point measurement of the outer diameter.

Fig.4 Measurement Range of the Nut

$$W = 4 + \frac{L}{8}$$

W : Length out of the measurement range (mm)

L : Nut length (mm)

## Features of Each Model

### LM Stroke

## Fit

In theory, the ball cage of model ST moves in the same direction as the ST shaft by 1/2 of the shaft (or nut). However, to minimize the travel distance error caused by uneven load distribution or vibrations, it is necessary to reduce the clearance. If high accuracy is required or if the LM Stroke is used on a vertical shaft, we recommend setting the radial clearance between 0 and 10  $\mu\text{m}$ .

Item	Normal conditions	Vertical shaft or high accuracy
ST shaft	k5, m5	n5, p5
Housing	H6, H7	J6, J7

## ST Shaft

With the ST shaft, used in model ST, balls roll directly on the shaft surface. Therefore, it is necessary to pay much attention to the hardness, surface roughness and dimensional accuracy when manufacturing it.

Since the hardness of the ST shaft has especially large impact on the service life, use much care in selecting a material and heat treatment method.

THK also manufactures high-quality ST shafts. Contact us for details.

### [Material]

Generally, the following materials are used as suitable for surface hardening through induction-hardening.

- SUJ2 (JIS G 4805: high-carbon chromium bearing steel)
- SK3 to 6 (JIS G 4401: carbon tool steel)
- S55C (JIS G 4051: carbon steel for machine structural use)

### [Hardness]

We recommend surface hardness of 58 HRC ( $\approx$ 653 HV) or higher. The depth of the hardened layer is determined by the shaft diameter; we recommend approximately 2 mm for general use.

The ST shaft can have a hardened inner ring attached on the shaft raceway.

### [Surface Roughness]

To achieve smooth motion, the surface is normally finished to 0.40a or less. If higher wear resistance is required, finish the surface to 0.20a or less.

## Installation of the ST Shaft

To install the ST shaft, drive it in to the designated depth. If the clearance is negative, a large driving force is required. However, do not forcibly hammer the shaft. Instead, apply a lubricant on the ST shaft first, and then gradually drive it in with a slight back action.

# Miniature Stroke

## Model MST

Fig.1 Structure of Miniature Stroke Model MST

## Structure and Features

Model MST consists of an ST shaft, ball cage and nut. These components can freely be combined according to the application. The sectional shape is small, the clearance is minimal and the motion is extremely light and smooth. Accordingly, model MST can be used in a variety of small, precision measuring equipment such as optic measuring instrument's spindle, pen plotter, OA equipment, computer terminals, automatic scale, digital length measuring machine and solenoid valve.

### [Highly Accurate Bearing]

Precision steel balls (sphericity in mutual difference: 0.0003 mm) compliant with JIS B 1501 are incorporated in a copper alloy ball cage to ensure high accuracy. The ball cage serves to prevent the balls from falling off with a unique ball-retaining design.

### [Highly Durable Bearing]

The nut of the ST shaft uses a selected material, and is heat-treated and ground. In addition, the raceways are finished with ultra fine finish. The rows of balls are densely arranged in the ball cage, and the balls are placed so that the ball raceways do not overlap with each other. It enables this model to be used over a long period without wear and to demonstrate high durability.

## Features of Each Model

### Miniature Stroke

#### [Compact Bearing]

Use of a combination of balls with a 1 mm diameter and a thin nut allows a small sectional shape and space-saving design.

#### [Bearing with Extremely Low Frictional Resistance]

Since the balls are in point-contact with the raceways, rolling loss is minimal and rolling motion with low-friction is achieved.

---

## Fit

---

The inner surface of the housing must be finished to H6 to H7, and secured with an adhesive after the nut is inserted.

When press fitting is required, mounting the nut to the hole will reduce the inner diameter. Therefore, be sure to check the inner diameter after press fitting the nut and adjust the shaft diameter so that a correct preload is achieved. Also make sure that the preload must not exceed  $-2\mu\text{m}$ .

---

## Travel Distance of the Ball Cage

---

The ball cage can travel up to 1/2 of the stroke length ( $l_s$ ) of the nut or the ST shaft in the same direction.

# Die-setting Ball Cage

Models KS and BS

Fig.1 Structure of Die-setting Ball Cage Model KS

## Structure and Features

With models KS and BS, a large number of precision steel balls (sphericity in mutual difference: 0.0005 mm) compliant with JIS B 1501 are incorporated in a lightweight, highly rigid ball cage. The balls are arranged along the circumference of the ball cage in spirals so that the ball raceways do not overlap with each other. It enables these models to be used over a long period without wear and to demonstrate high durability.

In addition, the ball pockets, which hold the balls, are finished with precision and continuously caulked with a unique process, enabling them to prevent the balls from falling. It allows the system to travel smoothly even if the ball cage is longer than the housing.

These ball cages are used in precision press die set, spinning and weaving machine, precision measuring instrument, automatic recorder, medical equipment and various machine tools.

## Rated Load and Service Life

The rated loads of models KS and BS are indicated in the respective specification tables. Their service lives are obtained using the service life equation for LM Stroke model ST on A-556.

## Fit

When using the Die-setting Ball Cage in the guide unit of the guide post of a precision press die set, normally select a negative clearance in order to increase the accuracy and the ball cage rigidity. Table1 shows typical fitting between the hole and the shaft. Select a combination of a hole and a shaft so that the clearance does not

exceed the tolerance value of the radial clearance indicated in the specification table.

Table1 Fitting between Holes and Shaft

Tolerance in hole dimensions: D	K5
Dimensional tolerance of the shaft: d	h5

## Installation of the Ball Cage

Fig.2 shows examples of mounting the Die-setting Ball Cage.

Fig.2 Example of Installation

## Precautions on Use

## LM Stroke

### [Handling]

- (1) Disassembling components may cause dust to enter the system or degrade mounting accuracy of parts. Do not disassemble the product.
- (2) Dropping or hitting the LM Stroke may damage it. Giving an impact force to the product could also cause damage even if the product looks intact.

### [Lubrication]

- (1) LM Stroke model ST can use either oil or grease as a lubricant. Select either lubricant according to the DN value. When using grease, we recommend high-quality lithium-soap group grease No. 2.
- (2) Thoroughly remove anti-rust oil and feed lubricant before using the product.
- (3) Do not mix lubricants of different physical properties.
- (4) In locations exposed to constant vibrations or in special environments such as clean rooms, vacuum and low/high temperature, normal lubricants may not be used. Contact THK for details.
- (5) When planning to use a special lubricant, contact THK before using it.

### [Precautions on Use]

- (1) Entrance of foreign material into LM Stroke model ST may cause abnormal wear or shorten the service life. When entrance of foreign material is predicted, it is important to select an effective sealing device or dust-control device that meets the environment conditions. For LM Stroke model ST, a special synthetic rubber seal (ST··UU) that is highly resistant to wear and a felt seal with high contamination protection effect and low seal resistance (ST··DD) are available for some types as contamination protection accessories.
- (2) If foreign material adheres to the product, replenish the lubricant after cleaning the product.
- (3) Contact THK if you desire to use the product at a temperature of 80°C or higher.
- (4) Please be careful when using the product in an environment with excessive coolant. The coolant may cause premature failure if it penetrates the bushing nut. Contact THK for further details.
- (5) When using the product in locations exposed to constant vibrations or in special environments such as clean rooms, vacuum and low/high temperature, contact THK in advance.

Fig.1 Types of the Seal for the LM Stroke

### [Storage]

When storing the LM Stroke, enclose it in a package designated by THK and store it while avoiding high temperature, low temperature and high humidity.

## Features

## Precision Linear Pack

# Features of the Precision Linear Pack

Fig.1 Structure of Precision Linear Pack Model ER

## Structure and Features

Model ER is a slide unit using a stainless steel plate that is precision formed, heat-treated and then ground. It has a structure where balls roll between the V-shaped grooves machined on the outer rail and the inner block to allow the system to slide. It is an ultra-thin, lightweight unit in which the balls circulate in a ball case incorporated in the inner block to perform infinite straight motion.

This model is used in extensive applications such as magnetic disc devices, electronic equipment, semiconductor manufacturing equipment, medical equipment, measuring equipment, plotting machines and photocopiers.

### [Reduced Design and Assembly Costs]

It provides a highly accurate linear guide system with lower design cost and fewer assembly man-hours than the conventional miniature ball bearings used in precision machines and other equipment.

### [Maintains Long-term Stability]

It is a ball-circulating type slide unit with an extremely small friction coefficient. This slide unit maintains stable performance over a long period of time.

### [Lightweight, Compact Design and High-speed Response]

The outer rail and the inner block are composed of very thin stainless steel plates.

Since the linear pack is light, it has a small inertial moment and demonstrates superb high-speed response.

# Rated Load and Nominal Life

## [Rated Loads in All Directions]

The basic load rating in the specification table indicates the rated load in the radial direction as shown in Fig.2. The rated loads in the reverse radial and lateral directions are obtained from Table1 below.

Fig.2 Rated Loads in All Directions

Table1 Rated Loads in All Directions

	Basic dynamic load rating	Basic static load rating
Radial direction	C (indicated in the specification table)	C <sub>0</sub> (indicated in the specification table)
Reverse radial direction	C <sub>L</sub> =C	C <sub>oL</sub> =C <sub>0</sub>
Lateral directions	C <sub>T</sub> =1.47C	C <sub>oT</sub> =1.73C <sub>0</sub>

## [Static Safety Factor f<sub>s</sub>]

Model ER may receive an unexpected external force while it is stationary or operative due to the generation of an inertia caused by vibrations and impact or start and stop. It is necessary to consider a static safety factor against such a working load.

$$f_s = \frac{f_c \cdot C_0}{P_c}$$

f<sub>s</sub> : Static safety factor (see Table2)

f<sub>c</sub> : Contact factor  
(see Table3 on A-568)

C<sub>0</sub> : Basic static load rating (N)

P<sub>c</sub> : Calculated load (N)

### ● Reference Value of Static Safety Factor

The static safety factors indicated in Table2 are the lower limits of reference values in the respective conditions.

Table2 Reference Value of Static Safety Factors (f<sub>s</sub>)

Machine using the LM system	Condition	Lower limit of f <sub>s</sub>
General industrial machinery	Without vibration or impact	1 to 1.3
	With vibration or impact	2 to 7

**[Nominal Life]**

The nominal life of model ER is obtained using the following equation.

$$L = \left( \frac{f_c}{f_w} \cdot \frac{C}{P_c} \right)^3 \times 50$$

- L : Nominal life (km)  
 (The total number of revolutions that 90% of a group of identical ER units independently operating under the same conditions can achieve without showing flaking)
- C : Basic dynamic load rating (N)
- P<sub>c</sub> : Calculated load (N)
- f<sub>c</sub> : Contact factor (see Table3)
- f<sub>w</sub> : Load factor (see Table4 on A-569)

**[Calculating the Service Life Time]**

When the nominal life (L) has been obtained, if the stroke length and the number of reciprocations per minute are constant, the service life time is obtained using the following equation.

$$L_h = \frac{L \times 10^6}{2 \times l_s \times n_r \times 60}$$

- L<sub>h</sub> : Service life time (h)
- l<sub>s</sub> : Stroke length (mm)
- n<sub>r</sub> : Number of reciprocations per minute (min<sup>-1</sup>)

● **f<sub>c</sub>: Contact Factor**

When multiple inner blocks are used in close contact with each other, their linear motion is affected by a moment load and mounting accuracy, making it difficult to achieve uniform load distribution. In such applications, multiply the basic load rating (C) and (C<sub>0</sub>) by the corresponding contact factor in Table3.

Table3 Contact Factor (f<sub>c</sub>)

Number of inner blocks in close contact with each other	Contact factor f <sub>c</sub>
2	0.81
3	0.72
Normal use 1	1

● **fw: Load Factor**

In general, reciprocating machines tend to involve vibrations or impact during operation. It is extremely difficult to accurately determine vibrations generated during high-speed operation and impact during frequent start and stop. Therefore, when the actual load applied on model ER cannot be obtained, or when speed and vibrations have a significant influence, divide the basic dynamic load rating (C) by the corresponding load factor in Table4 of empirically obtained data.

Table4 Load Factor (fw)

Vibrations/ impact	Speed(V)	fw
Faint	Very low $V \leq 0.25\text{m/s}$	1 to 1.2
Weak	Slow $0.25 < V \leq 1\text{m/s}$	1.2 to 1.5

## Accuracy Standards

The running straightness of model ER is indicated in Table5. (See Fig.3.)

Table5 Running Straightness Unit: mm

Fig.3 Method for Measuring Running Straightness

Stroke length		Running straightness of inner block in vertical directions Δ1	Running straightness of inner block in horizontal directions Δ2
Above	Or less		
—	20	0.002	0.004
20	40	0.003	0.006
40	60	0.004	0.008
60	80	0.005	0.010
80	100	0.006	0.012
100	120	0.008	0.016

Precision Linear Pack

## Radial Clearance

The radial clearance of model ER means the value for the motion of the central part of the inner block when the inner block is slightly moved with a vertically constant force in the middle of the outer rail in the longitudinal direction. The negative values in table 6 indicate that the respective models are provided with a pre-load when assembled and have no clearance between their inner blocks and the outer rails.

Table6 Radial Clearance Unit: μm

Model No.	Radial clearance	
	Normal	C1
ER 513	±2	-2 to 0
ER 616	±2	-3 to 0
ER 920	±2	-4 to 0
ER 1025	±3	-6 to 0

Note) When desiring normal clearance, add no symbol; when desiring C1 clearance, indicate "C1" in the model number. (see "Model number coding" on B-476)

## Precautions on Use

## Precision Linear Pack

### [Handling]

- (1) Disassembling components may cause dust to enter the system or degrade mounting accuracy of parts. Do not disassemble the product.
- (2) Dropping or hitting the Precision Linear Pack may damage it. Giving an impact to the product could also cause damage to its function even if the product looks intact.
- (3) Removing the inner block of the Precision Linear Pack from the outer rail or letting it overshoot will cause balls to fall off.

### [Lubrication]

- (1) Thoroughly remove anti-rust oil with a cleaning detergent and apply lubricant before using the product. As the most suitable grease, we recommend THK AFC Grease, which maintains lubricity over a long period of time. For lubrication in a clean room, low dust generation THK AFE-CA Grease and THK AFF Grease are recommended.
- (2) Do not mix lubricants of different physical properties.
- (3) In locations exposed to constant vibrations or in special environments such as clean rooms, vacuum and low/high temperature, normal lubricants may not be used. Contact THK for details.
- (4) When planning to use a special lubricant, contact THK before using it.

### [Installation]

The mounting surface of Precision Linear Pack model ER must be finished to the maximum accuracy.

For securing the outer rail of models ER513 and ER613, also purchase and use No. 0 screws for precision equipment (see Table1). (If using ordinary screws, the inner block may hit the screw head.)

Table1 Outer Rail Fixing Screws for Models ER513 and ER616

Model No.	Type	Nominal name of screw × pitch
ER 513	No. 0 pan-head screw (class 1)	M2×0.4
ER 616		M2.6×0.45

Japan Camera Industry Association Standard JCIS 10-70  
Cross-recessed screw for precision equipment (No. 0 screw)

### [Precautions on Use]

- (1) Entrance of foreign material may cause damage to the ball circulating component or functional loss. Prevent foreign material, such as dust or cutting chips, from entering the system.
- (2) If foreign material such as dust of cutting chips adheres to the product, replenish the lubricant after cleaning the product with pure white kerosene.
- (3) Contact THK if you desire to use the product at a temperature of 80°C or higher.
- (4) When using the product in locations exposed to constant vibrations or in special environments such as clean rooms, vacuum and low/high temperature, contact THK in advance.

### [Storage]

When storing the Precision Linear Pack, enclose it in a package designated by THK and store it while avoiding high temperature, low temperature and high humidity.

## Features and Types

## Cross Roller Guide/Ball Guide

### Features of the Cross Roller Guide/Ball Guide

Fig.1 Structure of Cross Roller Guide Model VR and Ball Guide Model VB

### Structure and Features

In model VR, precision rollers are orthogonally aligned one after another in a roller cage that is combined with a dedicated rail having a raceway cut into a V-shape groove. When two units of the Cross Roller Guide are mounted in parallel, the guide system is capable of receiving loads in the four directions. In addition, since the Cross Roller Guide can be given a preload, a clearance-free, highly rigid and smooth slide mechanism is achieved.

Model VB is a low-friction, high-accuracy, finite LM system consisting of precision steel balls, arranged in short pitches in a ball cage model B, and a dedicated rail model V.

The Cross Roller Guide and the Ball Guide are used in the slide unit of various devices such as OA equipment and its peripherals, measuring instruments, precision equipment including a printed circuit board drilling machine, optic measuring machines, optic stages, handling mechanisms and X-Ray machines.

## Features and Types

### Features of the Cross Roller Guide/Ball Guide

#### [Long Service Life, High Rigidity]

With a unique roller retaining mechanism, the effective contact length of the rollers is 1.7 times greater than the conventional type. Furthermore, the roller pitch interval is short and a sufficient number of rollers are installed, thus increasing the rigidity by two and the service life by six times greater than the conventional type. As a result, a safety-oriented design against vibrations and impact, which commonly occur in ordinary straight motion mechanisms, can be achieved.

#### [Smooth Motion]

With model VR, the rollers are individually held in a cage and roller pockets formed on the cage are in surface contact with the rollers to increase grease retention. Thus, smooth motion with little wear and friction is achieved.

#### [Highly Corrosion Resistant]

Model VR series and model VB series both include types made of stainless steel, which is highly corrosion resistant.

# Types of the Cross Roller Guide/Ball Guide

## Types and Features

### Cross Roller Guide Model VR

[Specification Table⇒B-480](#)

A compact, highly rigid LM system whose roller cage holding precision rollers orthogonally aligned one after another travels by half the stroke on a V-shaped groove formed on a rail.

Model VR

### Ball Guide Model VB

[Specification Table⇒B-498](#)

A low-friction, highly accurate LM system whose ball cage holding precision balls in short pitches travels by half the stroke on a V-shaped groove formed on a rail.

Model VB

## Rated Load and Nominal Life

### [Rated Loads in All Directions]

The basic load ratings ( $C_z$  and  $C_{0z}$ ) in the specification table indicate the values per rolling element in the directions shown in Fig.1. When obtaining the nominal life, calculate the basic load ratings ( $C$  and  $C_0$ ) of the actually used rolling elements from the equation below.

● For Model VR

$$C = C_L = \left(\frac{Z}{2}\right)^3 \times C_{z}, \quad C_T = 2C$$

$$C_0 = C_{0L} = \frac{Z}{2} \times C_{0z}, \quad C_{0T} = 2C_0$$

⎧ For  $\frac{Z}{2}$ , truncate the decimals. ⎫

● For Model VB

$$C = C_L = Z^{\frac{2}{3}} \times C_{z}, \quad C_T = 2C$$

$$C_0 = C_{0L} = Z \times C_{0z}, \quad C_{0T} = 2C_0$$

- C : Basic dynamic load rating (kN)
- $C_0$  : Basic static load rating (kN)
- $C_z$  : Basic dynamic load rating in the specification table (kN)
- $C_{0z}$  : Basic static load rating in the specification table (kN)
- Z : Number of rolling elements used (number of rolling elements within the effective load range)

Fig.1

**[Static Safety Factor  $f_s$ ]**

Models VR and VB may receive an unexpected external force while it is stationary or operative due to the generation of an inertia caused by vibrations and impact or start and stop. It is necessary to consider a static safety factor against such a working load.

$$f_s = \frac{C_0}{P_c}$$

$f_s$  : Static safety factor (see Table1)  
 $C_0$  : Basic static load rating (kN)  
 $P_c$  : Calculated load (kN)

Table1 Reference Values of Static Safety Factor ( $f_s$ )

Machine using the LM system	Basic dynamic load rating	Lower limit of $f_s$
General industrial machinery	Without vibration or impact	1 to 1.3
	With vibration or impact	2 to 3

**[Nominal Life]**

When the basic dynamic load ratings have been obtained, the rated lives of model VR and model VB are obtained using the following equations.

**● For Model VR**

$$L = \left( \frac{f_r}{f_w} \cdot \frac{C}{P_c} \right)^{\frac{10}{3}} \times 100$$

**● For Model VB**

$$L = \left( \frac{f_r}{f_w} \cdot \frac{C}{P_c} \right)^3 \times 50$$

$L$  : Nominal life (km)  
 (The total number of revolutions that 90% of a group of identical VR (VB) units independently operating under the same conditions can achieve without showing flaking)  
 $C$  : Basic dynamic load rating (kN)  
 $P_c$  : Calculated load (kN)  
 $f_r$  : Temperature factor (see Fig.2 on A-577)  
 $f_w$  : Load factor (see Table2 on A-577)

**[Calculating the Service Life Time]**

When the nominal life ( $L$ ) has been obtained, if the stroke length and the number of reciprocations per minute are constant, the service life time is obtained using the following equation.

$$L_h = \frac{L \times 10^6}{2 \times l_s \times n_1 \times 60}$$

$L_h$  : Service life time (h)  
 $l_s$  : Stroke length (mm)  
 $n_1$  : Number of reciprocations per minute ( $\text{min}^{-1}$ )

● **f<sub>t</sub>: Temperature Factor**

If the temperature of the environment surrounding the operating model VR or VB exceeds 100 °C , take into account the adverse effect of the high temperature and multiply the basic load ratings by the temperature factor indicated in Fig.2.

Note) If the environment temperature exceeds 100 °C , contact THK.

Fig.2 Temperature Factor (f<sub>t</sub>)

● **f<sub>w</sub>: Load Factor**

In general, reciprocating machines tend to involve vibrations or impact during operation. It is extremely difficult to accurately determine vibrations generated during high-speed operation and impact during frequent start and stop. Therefore, when the actual load applied on model VR or VB cannot be obtained, or when speed and vibrations have a significant influence, divide the basic load rating (C or C<sub>0</sub>), by the corresponding load factor in Table2 of empirically obtained data.

Table2 Load Factor (f<sub>w</sub>)

Vibrations/ impact	Speed(V)	f <sub>w</sub>
Faint	Very low V ≤ 0.25m/s	1 to 1.2
Weak	Slow 0.25 < V ≤ 1m/s	1.2 to 1.5

## Accuracy Standards

The accuracy of the dedicated rail for the Cross Roller Guide is classified into high accuracy grade (H) and precision grade (P) as shown in Table3.

Fig.3

Table3 Accuracy Standards for Dedicated Rail Model V

Unit: mm

Accuracy grades	High-accuracy grade	Precision grade
Symbol	H	P
Item		
Parallelism of the raceway against surfaces A and B	As per Fig.4	
Dimensional tolerance in height E	±0.02	±0.01
Difference in height E (note)	0.01	0.005
Dimensional tolerance in width M	$\begin{matrix} 0 \\ -0.2 \end{matrix}$	$\begin{matrix} 0 \\ -0.1 \end{matrix}$

Note) The difference in height E applies to four rails used on the same plane.

Fig.4 Rail Length and Parallelism of the Raceway

## Point of Design

## Cross Roller Guide/Ball Guide

### Installation Procedure

When using clearance adjustment bolts:

- (1) Closely contact rails 2 and 3 onto the base, and rail 1 onto the table, and then firmly tighten the rail mounting bolts.

- (2) Temporarily fasten rail 4 to the table.

Note) The rail mounting bolts must be designed so that they can be fully fastened while maintaining the rail installed.

- (3) Place the base and the tables as shown in Fig.1, and then insert the roller cage from the end. If the cage does not enter because there is no clearance, slide rail 4 toward the adjustment bolt first, and then insert the cage again.

- (4) Place a dial gauge as shown in Fig.1. Then, lightly screw all adjustment bolts evenly until the clearance is almost eliminated while gently pressing the table sideways.

- (5) Attach the stopper to the rail end.

- (6) Slide the table and adjust the cage position so as to achieve the required stroke.

- (7) Position the roller cage in the center of the rail as shown in Fig.2-1. Then, evenly tighten the adjustment bolts (b, c and d) that are within the area where the roller is present until the dial gauge indicates the required displacement. Fully fasten the mounting bolts where adjustment was performed.

Note) The displacement indicated on the gauge represents the preload per roller cage.

- (8) Slide the table as shown in Fig.2-2, and adjust the remaining adjustment bolts (a and e) in the same manner.

Note) When installing two or more units, first measure the tightening torque of the adjustment bolts for the first unit or the sliding resistance of the first unit. Then, install the second (and later) unit so that its/their tightening torque(s) or sliding resistance(s) equal(s) that of the first unit. In this way, almost uniform preloads can be provided.

Fig.1 Installation of the Cross Roller Guide

Fig.2 Sequence of Tightening the Adjustment Bolts

## Example of Clearance Adjustment

Design the adjustment bolt so that it presses the rail on the same level as the roller.

Normally, press the rail with the adjustment bolt.

When a certain level of accuracy and rigidity is required, use a presser plate.

When high accuracy and high rigidity are required, use tapered gibs 1 and 2.

Fig.3 Example of Clearance Adjustment

## Preload

An excessive preload may cause indentation, shorten the service life or cause trouble. The permissible preload per roller cage is indicated in the specification table. Tighten the adjustment bolts while monitoring the displacement of the roller contact area.

## Accuracy of the Mounting Surface

To achieve a high level of running accuracy, it is also necessary to establish a certain level of accuracy in parallelism and straightness. Preferably, the parallelism and the flatness of the rail-mounting surface should be finished by grinding or similar machining to at least the same degree as the parallelism of the rail (see A-578). Also, mount the rail so that it closely contacts the mounting surface.

# Dedicated Mounting Bolt

To mount the rail where normal clearance is to be adjusted, use the screw hole drilled on the rail as shown in Fig.1. The holes of the bolt ( $d_1$  and  $D_1$ ) must be machined so that they are greater by the adjustment allowance.

Fig.1

If it is inevitable to adopt a mounting method like the one shown in Fig.2 for a structural reason, use the dedicated mounting bolt (S) indicated in Fig.3.

Fig.2

Table1 Dedicated Mounting Bolt

Unit: mm

Model No.	S	d	D	H	L	B	Supported rail
S 3	M3	2.3	5	3	12	2.5	V3
S 4	M4	3.1	5.8	4	15	3	V4

Fig.3 Dedicated Mounting Bolt

## Precautions on Use

## Cross Roller Guide/Ball Guide

### [Handling]

- (1) Disassembling components may cause dust to enter the system or degrade mounting accuracy of parts. Do not disassemble the product.
- (2) Dropping or hitting the Cross Roller Guide/Ball Guide may damage it. Giving an impact to it could also cause damage to its function even if the product looks intact.

### [Lubrication]

- (1) Thoroughly remove anti-rust oil and feed lubricant before using the product.
- (2) Do not mix lubricants of different physical properties.
- (3) In locations exposed to constant vibrations or in special environments such as clean rooms, vacuum and low/high temperature, normal lubricants may not be used. Contact THK for details.
- (4) When planning to use a special lubricant, contact THK before using it.

### [Rail Length]

The roller cage and the ball cage move half the travel distance of the table in the same direction. To prevent the cage from overhanging from the raceway base when the cage length is " $l$ " and the stroke length is " $l_s$ ", the rail length ( $L_k$ ) must be at least the following.

$$L_k \geq l + \frac{l_s}{2}$$

### [Offset of the Cage]

The cage, which retains rollers (or balls), demonstrates extremely accurate motion. However, it may be offset as affected by driving vibrations, inertia or impact.

If using the Cross Roller Guide or Ball Guide in the following conditions, contact THK.

- Vertical use
- Pneumatic cylinder drive
- Cam drive
- High speed crank drive
- Under a large moment load
- Butting the guide's external stopper with the table

## Precautions on Use

### [Stopper]

Stoppers are attached to the rail ends in order to prevent the cage from falling off. Note, however, that frequently colliding the cage with the stopper may cause wear of the stopper and loosening of the stopper fastening screws, and may cause the cage to fall off.

### [Contamination Protection]

As a means to prevent foreign material from entering the Cross Roller Guide or the Ball Guide, contamination protection accessories for the side faces as shown in Fig.1 are available. For contamination protection in the front and rear directions, consider using a bellows or a telescopic cover.

Fig.1 Contamination Protection Methods

### [Precautions on Use]

- (1) If foreign material adheres to the product, replenish the lubricant after cleaning the product.
- (2) Contact THK if you desire to use the product at a temperature of 100°C or higher.
- (3) When using the product in locations exposed to constant vibrations or in special environments such as clean rooms, vacuum and low/high temperature, contact THK in advance.

### [Storage]

When storing the Cross Roller Guide/Ball Guide, enclose it in a package designated by THK and store it while avoiding high temperature, low temperature and high humidity.

## Features and Types

## Cross Roller Table

### Features of the Cross Roller Table

Fig.1 Structure of the Cross Roller Table

### Structure and Features

The Cross Roller Table is a compact, highly rigid finite linear guide unit that has the Cross Roller Guide(s) between the precision-machined table and base.

There are two types of the Cross Roller Table: model VRU, and a miniature type model VRT. The Cross Roller Table is used in extensive applications such as OA equipment and peripherals, measuring instruments and printed circuit board drilling machines.

## Features and Types

### Features of the Cross Roller Table

#### [Easy Installation]

Since the Cross Roller Guide(s) is installed between the precision-machined table and base, a highly accurate linear guide mechanism is achieved simply by mounting the product with bolts.

#### [Large Permissible Load]

Since rollers with large rated loads are installed in short pitches, the cross roller guide is capable of bearing a heavy load, achieving a highly rigid linear guide mechanism and gaining a long service life.

#### [Diversified Usage]

Since the rollers are orthogonally arranged one after another, the guide system is capable of evenly receiving loads in the four directions applied on the table. (See Fig.2.)

Fig.2 Load Directions

#### [Highly Corrosion Resistant]

The base and the table of models VRT-M and VRT-AM use stainless steel. Their rails, rollers, roller cages and screws are also made of stainless steel. As a result, these guide systems have significantly high corrosion resistance.

The base and the table of model VRU-M are made of aluminum.

Model VRT

Model VRT-A

Model VRU

## Rated Load and Nominal Life

### [Rated Loads in All Directions]

The rated loads of models VRT, VRT-A and VRU are equal in four directions (radial, reverse radial and lateral directions), and their values are expressed as C and C<sub>0</sub> in the corresponding specification tables.

### [Static Safety Factor f<sub>s</sub>]

The Cross Roller Table may receive an unexpected external force while it is stationary or operative due to the generation of an inertia caused by vibrations and impact or start and stop. It is necessary to consider a static safety factor against such a working load.

$$f_s = \frac{C_0}{P_c} \quad \text{or} \quad f_s = \frac{M_0}{M}$$

f<sub>s</sub> : Static safety factor

C<sub>0</sub> : Basic static load rating (kN)

M<sub>0</sub> : Static permissible moment (M<sub>A</sub>, M<sub>B</sub> and M<sub>C</sub>)

P<sub>c</sub> : Calculated load (kN)

M : Calculated moment (kN)

### ● Reference value of static safety factor

The static safety factors indicated in Table1 are the lower limits of reference values in the respective conditions.

Table1 Reference Values of Static Safety Factor (f<sub>s</sub>)

Machine using the LM system	Basic dynamic load rating	Lower limit of f <sub>s</sub>
General industrial machinery	Without vibration or impact	1 to 1.3
	With vibration or impact	2 to 3

**[Nominal Life]**

The nominal life of the Cross Roller Table is obtained using the following equation.

$$L = \left( \frac{f_T}{f_w} \cdot \frac{C}{P_c} \right)^{\frac{10}{3}} \times 100$$

- L** : Nominal life (km)  
 (The total number of revolutions that 90% of a group of identical VRT, VRT-A or VRU units independently operating under the same conditions can achieve without showing flaking)
- C** : Basic dynamic load rating (kN)
- P<sub>c</sub>** : Calculated radial load (kN)
- f<sub>T</sub>** : Temperature factor  
 (see Fig.1 on A-590)
- f<sub>w</sub>** : Load factor (see Table2 on A-590)

**[Calculating the Service Life Time]**

When the nominal life (L) has been obtained, if the stroke length and the number of reciprocations per minute are constant, the service life time is obtained using the following equation.

$$L_h = \frac{L \times 10^6}{2 \times l_s \times n_1 \times 60}$$

- L<sub>h</sub>** : Service life time (h)
- l<sub>s</sub>** : Stroke length (mm)
- n<sub>1</sub>** : Number of reciprocations per minute (min<sup>-1</sup>)

● **f<sub>r</sub>: Temperature Factor**

If the temperature of the environment surrounding the operating model VRT, VRT-A or VRU exceeds 100 °C , take into account the adverse effect of the high temperature and multiply the basic load ratings by the temperature factor indicated in Fig.1.

Note) If the environment temperature exceeds 100 °C , contact THK.

Fig.1 Temperature Factor (f<sub>r</sub>)

● **f<sub>w</sub>: Load Factor**

In general, reciprocating machines tend to involve vibrations or impact during operation. It is extremely difficult to accurately determine vibrations generated during high-speed operation and impact during frequent start and stop. Therefore, when the actual load applied on model VRT, VRT-A or VRU cannot be obtained, or when speed and vibrations have a significant influence, divide the basic load rating (C or C<sub>0</sub>), by the corresponding load factor in Table2 of empirically obtained data.

Table2 Load Factor (f<sub>w</sub>)

Vibrations/ impact	Speed(V)	f <sub>w</sub>
Faint	Very low V ≤ 0.25m/s	1 to 1.2
Weak	Slow 0.25 < V ≤ 1m/s	1.2 to 1.5

## Accuracy Standards

The dimensional tolerances of Cross Roller Table models VRT, VRT-A and VRU in height (M) and width (W), and the running accuracy of the base against the mounting surfaces C and D are indicated in the corresponding specification tables.

Fig.2 Accuracy Standards

## Precautions on Use

## Cross Roller Table

### [Handling]

- (1) Disassembling components may cause dust to enter the system or degrade mounting accuracy of parts. Do not disassemble the product.
- (2) Dropping or hitting the Cross Roller Table may damage it. Giving an impact to it could also cause damage to its function even if the product looks intact.

### [Lubrication]

- (1) For lubrication of the Cross Roller Table, use lithium-soap group grease or oil when it is necessary as with ordinary bearings.
- (2) Thoroughly remove anti-rust oil and feed lubricant before using the product.
- (3) Do not mix lubricants of different physical properties.
- (4) In locations exposed to constant vibrations or in special environments such as clean rooms, vacuum and low/high temperature, normal lubricants may not be used. Contact THK for details.
- (5) When planning to use a special lubricant, contact THK before using it.

### [Additional Machining of the Table and the Base]

When additionally machining the table and the base of the Cross Roller Table according to the conditions such as drilling mounting holes, adhere to the following precautions.

- (1) Do not let cutting chips enter the Cross Roller Guide unit.
- (2) Machine the mounting holes as blind holes, not through holes.

THK can perform additional machining such as mounting holes as requested.

The clearance of the Cross Roller Table is adjusted to the appropriate preload. Do not touch the clearance adjustment screw.

### [Offset of the Cage]

The cage, which retains rollers (or balls), demonstrates extremely accurate motion. However, it may be offset as affected by driving vibrations, inertia or impact.

If using the Cross Roller Guide or Ball Guide in the following conditions, contact THK.

- Vertical use
- Pneumatic cylinder drive
- Cam drive
- High speed crank drive
- Under a large moment load
- Butting the guide's external stopper with the table

**[Precautions on Use]**

- (1) Entrance of foreign material may cause damage to the ball circulating component or functional loss. Prevent foreign material, such as dust or cutting chips, from entering the system.
- (2) If foreign material adheres to the product, replenish the lubricant after cleaning the product.
- (3) Contact THK if you desire to use the product at a temperature of 100°C or higher.
- (4) When using the product in locations exposed to constant vibrations or in special environments such as clean rooms, vacuum and low/high temperature, contact THK in advance.

**[Storage]**

When storing the Cross Roller Table, enclose it in a package designated by THK and store it while avoiding high temperature, low temperature and high humidity.

## Features and Types

## Linear Ball Slide

### Features of the Linear Ball Slide

Fig.1 Structure of Linear Ball Slide Model LSP

### Structure and Features

The Linear Ball Slide is a highly corrosion resistant slide unit that has an extremely low friction coefficient because stainless steel balls roll on four stainless steel needle roller raceways that are hardened and ground.

In addition, model LSP has a pinion gear in the center and a rack on the base to prevent the cage from slipping.

A ball slide equipped with a cylinder model LSC has a cylinder for drive in the base to downsize the system and reduce the space and the weight.

Its components are all made of stainless steel, which is highly corrosion resistant. Furthermore, since its inertia is small, the slide system is highly responsive to high speed. By simply securing the Linear Ball Slide on the mounting surface, the user can easily achieve a linear guide mechanism. Thus, this slide system is optimal for locations requiring high accuracy, such as optic measuring machines, automatic recorders, small electronic-parts assembling machines, OA equipment and its peripherals.

## Features and Types

### Features of the Linear Ball Slide

#### [A Unit Type That Allows Easy Installation]

The clearance and motion of the slider is adjusted to the best state. Therefore, a highly accurate slide mechanism can be gained by simply mounting the unit on the flat-finished mounting surface.

#### [Lightweight and Compact]

A light aluminum alloy is used in the base and the slider to reduce the weight.

#### [Smooth Motion]

The balls and the raceway (needle roller raceway) are in point contact, which causes the smallest rolling loss, and the balls are evenly retained in the ball cage. This allows the slide system to perform rolling motion at a minimal coefficient of friction ( $\mu = 0.0006$  to  $0.0012$ ).

#### [Highly Corrosion Resistant]

The base and the slider are made of an aluminum alloy and their surfaces are treated with alumite (anodization processing), which is highly resistant to corrosion and wear.

The balls, needle roller raceways and screws are made of stainless steel, making the system highly corrosion resistant.

# Types of the Linear Ball Slide

## Types and Features

### Linear Ball Slide with a Rack Model LSP [Specification Table⇒B-514](#)

With model LSP, the cage has a rack and pinion mechanism, thus to prevent the cage from slipping.

Also, since the cage does not slip even in vertical mount, this model is used in an even broader range of applications.

Note) Do not use the stopper as a mechanical stopper.

Model LSP

### Linear Ball Slide Model LS [Specification Table⇒B-516](#)

Model LS is a unit-type linear system for finite motion that has a structure where balls are arranged between the base and the slider via a needle roller raceway.

It is incorporated with a stopper mechanism, thus to prevent damage deformation caused by collision between the cage and the endplate.

Note) Do not use the stopper as a mechanical stopper.

Model LS

### Linear Ball Slide with a Cylinder Model LSC [Specification Table⇒B-518](#)

Model LSC contains an air cylinder for drive inside the base. Feeding air from the two ports on the side face of the base allows the slide to perform reciprocating motion. Since the cylinder is of double-acting type, horizontal traveling speed can be adjusted using the speed controller. The cylinder and the piston are made of a corrosion resistant aluminum alloy, and their surfaces are specially treated to increase wear resistance and durability. Additionally, the cage has a rack and pinion mechanism, thus enabling the cage to operate without slipping.

Air-feeding ports for piping are provided on one side face, ensuring a certain degree of operability and easy assembly even if the installation site has a limited space and is complex.

The table on the right shows the specifications of the air cylinder incorporated in model LSC.

Note) Do not use the stopper as a mechanical stopper.

Model LSC

<Cylinder specifications>

Type of action	Double-acting
Fluid used	air (no lubrication)
Working pressure	100 kPa to 700 kPa (1 kgf/cm <sup>2</sup> to 7 kgf/cm <sup>2</sup> )
Stroke velocity	50 to 300mm/s

## Features and Types

### Types of the Linear Ball Slide

#### [Speed Controller]

Fig.2 shows the shape of the speed controller.

Note) The speed controller is optional.  
(control method: meter out)

Fig.2 Shape of the Speed Controller (common to all model numbers)

#### [Dedicated Unit Base Model B]

With Linear Ball Slide model LSC, a limit switch for detecting the stroke end can be mounted using a dedicated unit base (Fig.3). When fine positioning is required, a dedicated stopper can be mounted on the unit base to adjust the position. (excluding model LSC1015)

Fig.3 Unit Base and Limit Switch Installation

Unit: mm

Unit base Model B	Unit base dimensions									Mass kg
	Length L	F	G	f <sub>1</sub>	g <sub>1</sub>	K	n	N	g <sub>2</sub>	
LSC1515	80	40	21	23	29.5	56	12	68	6	0.12
LSC1530	110	60	25	40	35	74	18	94	8	0.16

Linear Ball Slide

**[Limit Switch]**

The specifications of the limit switch are as follows.

&lt;Limit switch specifications&gt;

Type	D2VW-5L2A-1 (Omron)
Contact type	contact (1C contact)

&lt;Rated Specifications&gt;

Type	Rated voltage (V)		Non-inductive load (A)				Inductive load (A)	
			Resistance load		Ramp load		Inductive load	
			Normally closed	Normally open	Normally closed	Normally open	Normally closed	Normally open
D2VW-5	AC	125	5		0.5		4	
		250	5		0.5		4	
	DC	30	5		3		4	
		125	0.4		0.1		0.4	

Note1) The above figures indicate the constant current.

Note2) Inductive load refers to power factor of 0.7 or greater (alternate current) and time constant of 7 ms or less (direct current).

Note3) Ramp load implies a rush current 10 times greater.

Note4) The above rated values apply when a test is conducted with the following conditions in accordance with JIS C 4505.

- (1) Ambient temperature: 20°C ± 2°C
- (2) Ambient humidity: 65% ± 5% RH
- (3) Operating frequency: 30 times/min

Note) For applications under a minute load (5 to 24 VDC), a minute-load type is available. Contact THK for details.

## Rated Load and Nominal Life

### [Rated Loads in All Directions]

The rated loads of models LS, LSP and LSC are identical in the vertical and horizontal directions.

### [Static Safety Factor $f_s$ ]

Linear Ball Slide models LS, LSP or LSC may receive an unexpected external force while it is stationary or operative due to the generation of an inertia caused by vibrations and impact or start and stop. It is necessary to consider a static safety factor against such a working load.

$$f_s = \frac{C_0}{P_c} \quad \text{or} \quad f_s = \frac{M_0}{M}$$

- $f_s$  : Static safety factor
- $C_0$  : Basic static load rating (N)
- $M_0$  : Static permissible moment (N-m)  
( $M_A$ ,  $M_B$  and  $M_C$ )
- $P_c$  : Calculated load (N)
- $M$  : Calculated moment (N-m)

### ● Reference Value of Static Safety Factor

The static safety factors indicated in Table1 are the lower limits of reference values in the respective conditions.

Table1 Reference Value of Static Safety Factors ( $f_s$ )

Machine using the LM system	Load conditions	Lower limit of $f_s$
General industrial machinery	Without vibration or impact	1 to 1.3
	With vibration or impact	2 to 7

**[Nominal Life]**

The service life of the Linear Ball Slide is obtained using the following equation.

$$L = \left( \frac{1}{f_w} \cdot \frac{C}{P_c} \right)^3 \times 50$$

L : Nominal life (km)

(The total number of revolutions that 90% of a group of identical Linear Ball Slide units independently operating under the same conditions can achieve without showing flaking)

C : Basic dynamic load rating (N)

P<sub>c</sub> : Calculated load (N)

f<sub>w</sub> : Load factor (see Table2)

**[Calculating the Service Life Time]**

When the nominal life (L) has been obtained, if the stroke length and the number of reciprocations per minute are constant, the service life time is obtained using the following equation.

$$L_h = \frac{L \times 10^6}{2 \times l_s \times n_1 \times 60}$$

L<sub>h</sub> : Service life time (h)

l<sub>s</sub> : Stroke length (mm)

n<sub>1</sub> : Number of reciprocations per minute (min<sup>-1</sup>)

**● f<sub>w</sub>: Load Factor**

In general, reciprocating machines tend to involve vibrations or impact during operation. It is extremely difficult to accurately determine vibrations generated during high-speed operation and impact during frequent start and stop. Therefore, when the actual load applied on model VR or VB cannot be obtained, or when speed and vibrations have a significant influence, divide the basic load rating (C or C<sub>0</sub>), by the corresponding load factor in Table2 of empirically obtained data.

Table2 Load Factor (f<sub>w</sub>)

Vibrations/ impact	Speed(V)	f <sub>w</sub>
Faint	Very low V ≤ 0.25m/s	1 to 1.2
Weak	Slow 0.25 < V ≤ 1m/s	1.2 to 1.5

## Accuracy Standards

The accuracies of Linear Ball Slide models LS, LSP and LSC are defined as follows.

Running parallelism of the top face of the slide

: 0.010mm MAX/10mm

Positioning repeatability of the top face of the slide

: 0.0015mm MAX

Fig.1 Accuracy Standards

## Precautions on Use

## Linear Ball Slide

### [Handling]

- (1) Disassembling components may cause dust to enter the system or degrade mounting accuracy of parts. Do not disassemble the product.
- (2) Dropping or hitting the Linear Ball Slide may damage it. Giving an impact to the product could also cause damage to its function even if the product looks intact.

### [Lubrication]

- (1) Apply lubricant before using the product.
- (2) Do not mix lubricants of different physical properties.
- (3) In locations exposed to constant vibrations or in special environments such as clean rooms, vacuum and low/high temperature, normal lubricants may not be used. Contact THK for details.
- (4) When planning to use a special lubricant, contact THK before using it.

### [Precautions on Use]

- (1) Entrance of foreign material may cause damage to the ball circulating component or functional loss. Prevent foreign material, such as dust or cutting chips, from entering the system.
- (2) If foreign material such as dust or cutting chips adheres to the product, replenish the lubricant after cleaning the product with pure white kerosene.
- (3) Contact THK if you desire to use the product at a temperature of 80°C or higher.
- (4) When using the product in locations exposed to constant vibrations or in special environments such as clean rooms, vacuum and low/high temperature, contact THK in advance.
- (5) The Linear Ball Slide is incorporated with a stopper mechanism that prevents the slider from coming off. If impact is given, the stopper may be damaged. Do not use this stopper as a mechanical stopper.

### [Storage]

When storing the Linear Ball Slide, enclose it in a package designated by THK and store it while avoiding high temperature, low temperature and high humidity.

## Features and Types

## LM Roller

### Features of the LM Roller

Fig.1 Structure of LM Roller Model LR

### Structure and Features

In the LM Roller, dual rollers assembled on the circumference of the precision-ground, rigid raceway base travel in infinite circulation while being held by a retainer. A center guide integrated with the raceway base is formed in the central part of the loaded area of the raceway base to constantly correct skewing of the rollers. This unique structure ensures smooth rolling motion. The LM Roller is used in applications such as the XYZ guide of NC machine tools, precision press ram guides, press dies changers and heavy-load conveyance systems.

## Features and Types

### Features of the LM Roller

#### [Supports an Ultra Heavy Load and Ensures Smooth Motion]

The LM Roller is compact and capable of carrying a heavy load, and one unit of model LR50130 (length: 130 mm; width: 82 mm; height: 42 mm) is capable of receiving a 255 kN load. Moreover, because of rolling motion, this model has a low friction coefficient ( $\mu = 0.005$  to  $0.01$ ) and is free from stick-slip, thus achieving highly accurate straight motion.

#### [High Combined Accuracy]

In general, when supporting a single plane with LM rollers, multiple units of LM rollers are combined on the same plane, and therefore, the height difference between the rollers significantly affects the machine accuracy and service life. With THK LM Roller, the user can select a combination of models with a height difference of up to  $2 \mu\text{m}$ .

#### [Rational Skewing-preventing Structure]

With an LM system using rollers, once the rollers skew, it increases friction resistance or decreases running accuracy.

To prevent skewing, the LM Roller has roller guides on the center of the retainer full circle, and in the center of the loaded area on the raceway base. This structure enables the LM Roller to automatically correct skewing caused by a mounting accuracy error and the rollers to travel in an orderly manner. It also allows the LM Roller to be installed with slant mount or wall mount while demonstrating high performance.

# Types of the LM Roller

## Types and Features

### Model LR

[Specification Table⇒B-524](#)

This model is designed to be fit into a groove machined on the mounting surface. By screwing bolts into four holes on the raceway base, it is secured on the mounting surface. (Fixture models SM and SE are also available.)

Model LR

### Model LR-Z

[Specification Table⇒B-524](#)

A lighter type that uses a resin retainer and is designed to be mounted in the same manner as model LR. Since it has a groove for installing a seal, a special rubber seal with a high contamination protection effect can easily be attached. In addition, this model is capable of high-speed traveling at 1 m/s.

Model LR-Z

### Model LRA

[Specification Table⇒B-525](#)

Just like model LR, this model is also designed to be fit into a groove. It is a compact type that can be mounted using fixture model SM or SE and bolts.

Model LRA

### Model LRA-Z

[Specification Table⇒B-525](#)

A lighter type that uses a resin retainer and is designed to be mounted in the same manner as model LRA. Since it has a groove for installing a seal, a special rubber seal with a high contamination protection effect can easily be attached. In addition, this model is capable of high-speed traveling at 1 m/s.

Model LRA-Z

## Model LRB

Since this model does not require a groove on the mounting surface, man-hours for machining can be reduced. It can be mounted using fixture model SMB or SE and bolts.

[Specification Table⇒B-526](#)

Model LRB

## Model LRB-Z

A lighter type that uses a resin retainer and is designed to be mounted in the same manner as model LRB. Since it has a groove for installing a seal, a special rubber seal with a high contamination protection effect can easily be attached. In addition, this model is capable of high-speed traveling at 1 m/s.

[Specification Table⇒B-526](#)

Model LRB-Z

## Model LRU

Since this model does not require a groove on the mounting surface, man-hours for machining can be reduced. By screwing bolts into four holes on the raceway base, it is secured on the mounting surface.

[Specification Table⇒B-527](#)

Model LRU

## Nominal Life

### [Static Safety Factor $f_s$ ]

The LM Roller may receive an unexpected external force while it is stationary or operative due to the generation of an inertia caused by vibrations and impact or start and stop. It is necessary to consider a static safety factor against such a working load.

$$f_s = \frac{f_c \cdot C_o}{P_c}$$

$f_s$  : Static safety factor

$f_c$  : Contact factor

(see Table2 on A-610)

$C_o$  : Basic static load rating (kN)

$P_c$  : Calculated load (kN)

### ● Reference Value of Static Safety Factor

The static safety factors indicated in Table1 are the lower limits of reference values in the respective conditions.

Table1 Reference Value of Static Safety Factors ( $f_s$ )

Machine using the LM system	Basic dynamic load rating	Lower limit of $f_s$
General industrial machinery	Without vibration or impact	1 to 1.3
	With vibration or impact	2 to 3
Machine tool	Without vibration or impact	1 to 1.5
	With vibration or impact	2.5 to 7

**[Nominal Life]**

The nominal life of the LM Roller is obtained using the basic dynamic load rating (C) indicated in the corresponding specification table, and the following equation.

$$L = \left( \frac{f_H \cdot f_c \cdot f_T}{f_w} \cdot \frac{C}{P_c} \right)^{\frac{10}{3}} \times 100$$

- L : Nominal life (km)  
 (The total number of revolutions that 90% of a group of identical LM Roller units independently operating under the same conditions can achieve without showing flaking)
- C : Basic dynamic load rating (kN)
- P<sub>c</sub> : Calculated radial load (kN)
- f<sub>H</sub> : Hardness factor (see Fig.1)
- f<sub>T</sub> : Temperature factor  
 (see Fig.2 on A-610)
- f<sub>c</sub> : Contact factor  
 (see Table2 on A-610)
- f<sub>w</sub> : Load factor (see Table3 on A-610)

**[Calculating the Service Life Time]**

When the nominal life (L) has been obtained, if the stroke length and the number of reciprocations per minute are constant, the service life time is obtained using the following equation.

$$L_h = \frac{L \times 10^6}{2 \times l_s \times n_1 \times 60}$$

- L<sub>h</sub> : Service life time (h)
- l<sub>s</sub> : Stroke length (mm)
- n<sub>1</sub> : Number of reciprocations  
 per minute (min<sup>-1</sup>)

**● f<sub>H</sub>: Hardness Factor**

To maximize the load capacity of the LM system, the hardness of the raceways needs to be between 58 to 64 HRC. If the hardness is lower than this range, the basic dynamic load rating and the basic static load rating decrease. Therefore, it is necessary to multiply each rating by the respective hardness factor (f<sub>H</sub>).

Fig.1 Hardness Factor (f<sub>H</sub>)

● **f<sub>r</sub>: Temperature Factor**

If the temperature of the environment surrounding the operating LM Roller exceeds 100°C, take into account the adverse effect of the high temperature and multiply the basic load ratings by the temperature factor indicated in Fig.2.

Note) The normal service temperature of the LM Roller is 80°C at a maximum. If the ambient temperature exceeds 80°C, contact THK.

Fig.2 Temperature Factor (f<sub>r</sub>)

● **f<sub>c</sub>: Contact Factor**

When multiple LM Roller units are used in near close contact with each other, their linear motion is affected by moments and mounting accuracy, making it difficult to achieve uniform load distribution. In such applications, multiply the basic load rating (C) and (C<sub>0</sub>) by the corresponding contact factor in Table2.

Note) If uneven load distribution is expected in a large machine, take into account the respective contact factor indicated in Table2.

Table2 Contact Factor (f<sub>c</sub>)

Number of LM Roller units in close contact with each other	Contact factor f <sub>c</sub>
2	0.81
3	0.72
4	0.66
5	0.61
Normal use	1

● **f<sub>w</sub>: Load Factor**

In general, reciprocating machines tend to involve vibrations or impact during operation. It is extremely difficult to accurately determine vibrations generated during high-speed operation and impact during frequent start and stop. Therefore, when the actual load applied to the LM Roller cannot be obtained, or when speed and impact have a significant influence, divide the basic load rating (C or C<sub>0</sub>) by the corresponding load factor in Table3 of empirically obtained data.

Table3 Load Factor (f<sub>w</sub>)

Vibrations/ impact	Speed(V)	f <sub>w</sub>
Faint	Very low V ≤ 0.25m/s	1 to 1.2
Weak	Slow 0.25 < V ≤ 1m/s	1.2 to 1.5
Medium	Medium 1 < V ≤ 2m/s	1.5 to 2
Strong	High V > 2m/s	2 to 3.5

## Accuracy Standards

When multiple LM Roller units are arranged on the same plane, the mounting heights of the LM Roller units must be identical in order to achieve uniform load distribution. The dimensional tolerance of the LM Roller in height (A) is defined as indicated in Table4. When ordering LM Roller units to be used on the same plane, specify their tolerances with the same classification symbol.

Each classification symbol is marked on the package box and on the side face of the LM Roller's raceway base as indicated in Fig.4. (except for normal grade)

Table4 Classification of Dimensional Tolerances in Height (A)  
Unit:  $\mu\text{m}$

Fig.3 Mounting Height (A) of the LM Roller

Fig.4

Accuracy Grades	Dimensional tolerance for A	Classification symbol
Normal grade	0 to -10	No Symbol
High grade	0 to -5	H5
	-5 to -10	H10
Precision grade	0 to -3	P3
	-3 to -6	P6
	-6 to -9	P9
	-9 to -12	P12
Ultra-precision grade	0 to -2	SP2
	-2 to -4	SP4
	-4 to -6	SP6
	-6 to -8	SP8
	-8 to -10	SP10

## Raceway

To maximize the performance of the LM Roller, it is necessary to take into account the hardness, surface roughness and accuracy of the raceway, on which the rollers directly roll, when manufacturing the product. In particular, the hardness significantly affects the service life. Therefore, it is important to take much care in selecting a material and heat treatment method.

### [Hardness]

We recommend surface hardness of 58 HRC ( $\approx$  653 HV) or higher. The depth of the hardened layer is determined by the size of the LM Roller; we recommend approximately 2 mm for general use. If the hardness of the raceway is lower or the raceway cannot be hardened, multiply the load rating by the corresponding hardness factor (see Fig.1 on A-609).

### [Material]

The following materials are generally used as suitable for surface hardening through induction-hardening and flame quenching.

- SUJ2 (JIS G 4805: high-carbon chromium bearing steel)
- SK3 to 6 (JIS G 4401: carbon tool steel)
- S55C (JIS G 4051: carbon steel for machine structural use)

If the machine body is a mold, depending on the conditions, a hardened steel plate may not be used and instead, the surface of mold itself may be hardened.

### [Surface Roughness]

To achieve smooth motion, the surface should preferably be finished to 0.40a or less. If slight wear is allowed in the initial stage, the surface may be finished to approximately 0.80a.

### [Accuracy]

When high accuracy is required, securing a hardened steel plate to the machine body may cause undulation on the raceway. To avoid this, secure the LM Roller with bolts before grinding the hardened steel plate as with when mounting the product, or tightening it to the machine body before grinding and finishing the raceway, to produce a good result.

# Installing the LM Roller

Fig.1 shows examples of installing the LM Roller. To minimize the gradient of the LM Roller in the traveling direction, provide a reference surface on the mounting surface and press the LM Roller toward it. The mounting reference surface of the LM Roller is opposite of the THK logo marked on the raceway base.

(a) Installing models LR, LRU and LR-Z

Use the four mounting bolt holes on the raceway base to mount the LM Roller.

For G and W<sub>1</sub>, see the specification table.

(b) Installing models LRA and LRA-Z

The LM Roller can easily be secured using fixture model SM or SE. SE is provided with a wiper to increase contamination protection effect.

For W<sub>1</sub>, see the specification table.

(c) Installing models LRB and LRB-Z

The LM Roller can easily be secured using fixture model SMB or SEB. SEB is provided with a wiper to increase contamination protection effect.

Fig.1 Installing the LM Roller

LM Roller

## Guidance for Adjusting the Clearance

To secure stable accuracy during operation, the LM Roller is provided with a light preload. Provision of a preload is especially effective also in increasing the service life for applications where a vibration impact load or overhang load is applied.

Fig.2 shows clearance adjusting methods that are commonly practiced.

Normally, it is preferable to provide a preload that is approximately 3% of the basic dynamic load rating (C). Providing a preload to the LM Roller will stabilize the accuracy.

(a) Using a dedicated stopper

(b) Using a set screw

(c) Adjusting a tapered gib

Fig.2 Methods for Adjusting the Clearance of the LM Roller

# Examples of Arranging LM Roller Units

LM Roller

## Examples of Installing the LM Roller

### Assembling the slide section

### Using the cross rail of a vertical lathe

## Spring Pad Model PA

● For detailed dimensions, see B-528.

Item name	Schematic diagram / mounting location	Purpose/location of use
Spring Pad Model PA		By attaching this spring pad to the back of the LM Roller as shown in Fig.2 (a) on A-614 . Turning the adjustment bolt, adjustment of a clearance and a preload can easily be done.

### [Guidance for Using the Spring Pad]

Spring pad model PA is a low price item that enables easy adjustment and achieves self-aligning. A preload can easily be adjusted by installing the spring pad to the machine and externally tightening the adjustment bolt using a torque wrench. As a result, the need for troublesome shim adjustment and machining for matching is eliminated.

#### ● Example of Using the Spring Pad

- (1) When using the spring pad in the opposite position to provide a preload

To prevent the table from lifting or guiding it horizontally, using the spring pad on one side as shown in Fig.1 will easily provide a preload and eliminate vibrations and play of the machine.

- (2) When applying both sliding and rolling on the same plane

When desiring to increase friction resistance because the table inertia is large, or desiring to increase rigidity under a heavy load, the spring pad can be used in combination with the sliding surface. To do so, install the LM Roller and the spring pad to several locations on the table as shown in Fig.2, and then tighten the adjustment bolt by the load to be allocated to the LM Roller.

Fig.1

Fig.2

● **Guidance for Installing the Spring Pad**

Fig.3 shows examples of installing the spring pad model PA to the bottom of the LM Roller and adjusting the clearance and providing a preload.

The dimensions in this example are indicated in the specification table for the spring pad model PA. The following is the procedure for the installation.

- (1) Secure the fixture and the spacer. Adjust them so that the LM Roller can move vertically.
- (2) Turn the adjustment bolt until the LM Roller hits the raceway.
- (3) Turn the adjustment bolt using a torque wrench and tighten it until the desired torque is reached. A preload is provided via the spring pad model PA.

Fig.3

## Fixture Models SM/SMB and SE/SEB

● For detailed dimensions, see B-529.

Item name	Schematic diagram / mounting location	Purpose/location of use
<b>Fixture Models SM/SMB and SE/SEB</b>		<p>Use of fixture model SM or SE eliminates the need to machine thin tapped holes for mounting the LM Roller, and allows the roller to firmly be secured. Models SE and SEB each have a special rubber wiper with double lips to achieve a high contamination protection effect.</p>

## Precautions on Use

## LM Roller

### [Handling]

- (1) Disassembling components may cause dust to enter the system or degrade mounting accuracy of parts. Do not disassemble the product.
- (2) Dropping or hitting the LM Roller may damage it. Giving an impact to the product could also cause damage to its function even if the product looks intact.

### [Contamination Protection and Lubrication]

With the LM Roller, once foreign material enters the raceway due to poor contamination protection, it cannot be removed easily and tends to severely damage the raceway or the LM rollers. Therefore, use much care in contamination protection.

Fixture for the LM Roller models SE and SEB each have a special rubber wiper with double lips to achieve a high contamination protection effect. Feeding grease between the double lips when attaching the fixture, as shown in Fig.1, will further increase the effect.

For locations subject to cutting chips or welding spatter, it is necessary to use a contamination protection cover such as a bellows and a telescopic cover, or a wiper reinforced with a metal plate as indicated in Fig.2.

Fig.1 Wiper of Fixture Models SE and SEB

Fig.2 Reinforced Wiper

For contamination protection of the side faces, items as shown in Fig.3 are available.

The required quantity of lubricant is much smaller than sliding guides, making the lubrication control easy.

As for the lubricant, the same type of grease or lubricant as that of ordinary bearings will be adequately effective. To achieve a high level of grease retention, it is preferable to use lithium-soap group grease No. 1 or 2, or slightly viscous sliding surface oil or turbine oil.

To replenish the lubricant to the LM Roller, drop the lubricant from the greasing hole provided on the back of the retainer as necessary, or directly drop it to the raceway. If the LM Roller is not used frequently, it is also possible to apply grease to the rollers of the product.

Fig.3

**[Mounting Reference Surface]**

To help correctly mount the LM Roller in the traveling direction, it has a mounting reference surface on the side face of the raceway base. The reference surface is on the opposite side of the THK logo.

**[Mounting Precision]**

To maximize the performance of the LM Roller, it is necessary to distribute the load as evenly as possible when mounting the product. For the parallelism between the roller and the raceway indicated in Fig.4, we recommend 0.015 mm or less against 100 mm. For the allowable tilt of the roller in the longitudinal direction, 0.01 mm or less against 100 mm is recommended.

(a) Parallelism between the LM Roller and the raceway    (b) Allowable tilt of the roller in the longitudinal direction

(c) Parallelism between the LM Roller and the raceway in the horizontal direction

Fig.4 LM Roller and Mounting Precision

**[Precautions on Use]**

- (1) If foreign material adheres to the product, replenish the lubricant after cleaning the product.
- (2) Do not use the resin retainer for LM Roller model LR (A, B)-Z and seals (including SE and SEB) in an environment at temperature of 80°C or higher.
- (3) When using the product in locations exposed to constant vibrations or in special environments such as clean rooms, vacuum and low/high temperature, contact THK in advance.

**[Storage]**

When storing the LM Roller, enclose it in a package designated by THK and store it while avoiding high temperature, low temperature and high humidity.

## Features and Types

## Flat Roller

### Features of the Flat Roller

Fig.1 Structure of LM Flat Roller Model FT

### Structure and Features

With the Flat Roller, precision rollers compliant with JIS B 1506 are installed in pockets of a cage made of a thin steel plate pressed into M shape (in cross section) to increase its rigidity. Thanks to its structural design, the rollers do not fall off because they are held in cage pockets. Since the cage, which is incorporated with rollers having a diameter of 5 mm or larger, is of roller-lifter type, smooth motion is achieved without damaging the raceway even if the hardness of the raceway is low. The Flat Roller is sandwiched between the two raceways. As the table moves, the Flat Roller travels by half the distance of the table in the same direction. For example, if the table moves 500 mm, the Flat Roller travels 250 mm in the same direction.

The Flat Roller is optimal for large machine tools such as planer, horizontal milling machines and cylindrical grinding machines, and for locations requiring high accuracy such as surface grinding machines, cylindrical grinder and optic measuring machines.

## Features and Types

### Features of the Flat Roller

#### [Large Load Capacity]

Since rollers are installed in short pitches, the Flat Roller has a large load capacity, and depending on the conditions, it can be used on the raceway of a mold that is little hardened. In addition, the deflection rigidity of the table is almost the same as that of a sliding surface.

#### [Combined Accuracy of 90° V Surface and Flat Surface Supported as Standard]

The Flat Roller is designed so that it can be mounted on the 90° V-flat sliding surface, which is the most common configuration among narrow guide types of tables and saddles of machinery. It allows the product to be used without major design change.

#### [Lowest Friction among Roller Type LM Systems]

Since the rollers are evenly held in a light, rigid cage, friction between rollers is eliminated and skewing of the rollers is minimized. As a result, a small friction coefficient ( $\mu = 0.001$  to  $0.0025$ ) is achieved, and stick-slip, which is problematic with sliding surfaces, does not occur.

#### [Instant Connection of the Cage]

When installing the Flat Roller in a large machine, it can easily be connected on the bed. This allows the Flat Roller to be installed even with the longest type.

# Types of the Flat Roller

## Types and Features

### Model FT/FT-V

[Specification Table⇒B-532](#)

These models have a single row of rollers and are mainly used on the flat surface.

Models FT/FT-V

### Model FTW/FTW-V

[Specification Table⇒B-533](#)

These models have two or more rows of rollers, and their cages are shaped to bend at 90°. Each model uses rollers with a diameter 0.7071 times greater than that of the rollers on the flat surface so that model FT or FT-V can be mounted on the 90° V surface at the same height if model FT or FT-V is used on the flat surface.

Models FTW/FTW-V

## Point of Selection

## Flat Roller

# Rated Load and Nominal Life

### [Static Safety Factor $f_s$ ]

The Flat Roller may receive an unexpected external force while it is stationary or operative due to the generation of an inertia caused by vibrations and impact or start and stop. It is necessary to consider a static safety factor against such a working load.

$$f_s = \frac{f_c \cdot C_0}{P_c}$$

$f_s$  : Static safety factor

$f_c$  : Contact factor

(see [Load Rating] and [Nominal Life] on A-626)

$C_0$  : Basic static load rating (kN)

$P_c$  : Calculated radial load (kN)

### ● Reference Value of Static Safety Factor

The static safety factors indicated in Table1 are the lower limits of reference values in the respective conditions.

Table1 Reference Value of Static Safety Factors ( $f_s$ )

Machine using the LM system	Basic dynamic load rating	Lower limit of $f_s$
General industrial machinery	Without vibration or impact	1 to 1.3
	With vibration or impact	2 to 3
Machine tool	Without vibration or impact	1 to 1.5
	With vibration or impact	2.5 to 7

**[Load Rating]**

The rated loads shown in the specification tables represent the rated loads with a unit length ( $\ell$ ) in the directions indicated in the figure below.

If the length of the Flat Roller in the effective load range differs from the unit length ( $\ell$ ), approximate rated loads ( $C_i$  and  $C_{0i}$ ) can be obtained using the following equation.

$$C_i = \left(\frac{\ell_0}{\ell}\right)^{\frac{3}{4}} \times C$$

$$C_{0i} = \frac{\ell_0}{\ell} \cdot C_0$$

- $C_i$  : Basic dynamic load rating in the effective load range (kN)
- $\ell_0$  : Length in effective load range (mm)
- $\ell$  : Unit length (see the specification table) (mm)
- $C_{0i}$  : Basic static load rating in the effective load range (kN)
- $C$  : Basic dynamic load rating (kN)
- $C_0$  : Basic static load rating (kN)

Note) Note that if the hardness of the raceway is lower than 58 HRC, the rated loads will be decreased. (See Fig.2 on A-627.)

**[Nominal Life]**

When the basic dynamic load rating ( $C_i$ ) of the Flat Roller in the effective load range has been obtained from the equation above, the nominal life is obtained using the following equation.

$$L = \left(\frac{f_H \cdot f_c \cdot f_T}{f_w} \cdot \frac{C_i}{P_c}\right)^{\frac{10}{3}} \times 100$$

- $L$  : Nominal life (km)  
(The total number of revolutions that 90% of a group of identical Flat Roller units independently operating under the same conditions can achieve without showing flaking)
- $C_i$  : Basic dynamic load rating (kN)
- $P_c$  : Calculated radial load (kN)
- $f_H$  : Hardness factor (see Fig.2 on A-627)
- $f_T$  : Temperature factor (see Fig.1 on A-627)
- $f_w$  : Load factor (see Table2 on A-627)
- $f_c$  : Contact factor<sup>(Note)</sup>

Note) Contact factor is determined according to the contact state of the two planes between which the rollers travel. If the contact ratio between the two planes is 50%, set the contact factor as  $f_c = 0.5$  for safety's sake.

[Calculating the Service Life Time]

When the nominal life (L) has been obtained, if the stroke length and the number of reciprocations per minute are constant, the service life time is obtained using the following equation.

$$L_h = \frac{L \times 10^6}{2 \times l_s \times n_1 \times 60}$$

- $L_h$  : Service life time (h)
- $l_s$  : Stroke length (mm)
- $n_1$  : Number of reciprocations per minute (min<sup>-1</sup>)

●  $f_T$ : Temperature Factor

If the temperature of the environment surrounding the operating Flat Roller exceeds 100 °C, take into account the adverse effect of the high temperature and multiply the basic load ratings by the temperature factor indicated in Fig.1.

Note) If the environment temperature exceeds 100 °C, contact THK.

Fig.1 Temperature Factor (f<sub>T</sub>)

●  $f_H$ : Hardness Factor

To maximize the load capacity of the LM system, the hardness of the raceways needs to be between 58 to 64 HRC. If the hardness is lower than this range, the basic dynamic load rating and the basic static load rating decrease. Therefore, it is necessary to multiply each rating by the respective hardness factor (f<sub>H</sub>).

Fig.2 Hardness Factor (f<sub>H</sub>)

●  $f_W$ : Load Factor

In general, reciprocating machines tend to involve vibrations or impact during operation. It is extremely difficult to accurately determine vibrations generated during high-speed operation and impact during frequent start and stop. Therefore, when the actual load applied cannot be obtained, or when speed and impact have a significant influence, divide the basic load rating (C or C<sub>0</sub>), by the corresponding load factor in Table2 of empirically obtained data.

Table2 Load Factor (f<sub>W</sub>)

Vibrations/impact	Speed(V)	f <sub>w</sub>
Faint	Very low V ≤ 0.25m/s	1 to 1.2
Weak	Slow 0.25 < V ≤ 1m/s	1.2 to 1.5
Medium	Medium 1 < V ≤ 2m/s	1.5 to 2
Strong	High V > 2m/s	2 to 3.5

## Accuracy Standards

The accuracy of the Flat Roller is classified into normal grade, high accuracy grade and precision grade according to the difference in diameter between the rollers incorporated in a single cage. When it is necessary to specify the dimensional tolerance in the roller diameter for reasons related to the required accuracy or combination, select the desired accuracy from Table3 and specify the corresponding accuracy symbol.

Table3 Classification of Roller Diameters for Selection

Unit:  $\mu\text{m}$

Fig.3

Accuracy grades	Diameter difference	Dimensional tolerance in diameter	Accuracy indication symbol
Normal grade	3	0 to -3	No Symbol
High grade	2	0 to -2	H2
		-2 to -4	H4
		-4 to -6	H6
Precision grade	1	0 to -1	P1

Note) The accuracy indication symbol is marked on the end of the cage as shown in Fig.3.

## Raceway

To maximize the performance of the Flat Roller, it is necessary to take into account the hardness, surface roughness and accuracy of the raceway, on which the rollers directly roll, when manufacturing the product. In particular, the hardness significantly affects the service life. Therefore, it is important to take much care in selecting a material and heat treatment method.

### [Hardness]

We recommend surface hardness of 58 HRC ( $\cong$  653 HV) or higher. The depth of the hardened layer is determined by the size of the Flat Roller; we recommend approximately 2 mm for general use. If the hardness of the raceway is lower or the raceway cannot be hardened, multiply the load rating by the corresponding hardness factor indicated in Fig.2 on A-627.

### [Material]

The following materials are generally used as suitable for surface hardening through induction-hardening and flame quenching.

- SUJ2 (JIS G 4805: high-carbon chromium bearing steel)
- SK3 to 6 (JIS G 4401: carbon tool steel)
- S55C (JIS G 4051: carbon steel for machine structural use)

If the machine body is a mold, depending on the conditions, a hardened steel plate may not be used and instead, the surface of mold itself may be hardened.

### [Surface Roughness]

To achieve smooth motion, the surface should preferably be finished to 0.40a or less. If slight wear is allowed in the initial stage, the surface may be finished to approximately 0.80a.

### [Accuracy]

When high accuracy is required, securing a hardened steel plate to the machine body may cause undulation on the raceway. To avoid this, secure the Flat Roller with bolts before grinding the hardened steel plate as with when mounting the product, or tightening it to the machine body before grinding and finishing the raceway, to produce a good result.

## Installing the Flat Roller

### [Combination of 90° V Surface and Flat Surface]

The Flat Roller can be mounted directly onto the guide surface on the 90° V surface and flat surface. Table1 shows examples of their combinations.

Note)The roller diameter (Da) for model numbers containing symbol V at the end represents the value  $\frac{1}{\sqrt{2}}$  times that of types for the same model number with no symbol.

The diameter of the roller to be combined with 90°V surface will be  $\frac{1}{\sqrt{2}}$  times that of the roller on the flat surface.

For example, when using model FT4035 (roller diameter:  $\phi 4$ ) on the flat surface, use model FTW4030V (roller diameter:  $\phi 2.828$ ) on the V surface. Performance of the Flat Roller is significantly affected by the contact state of the upper and lower raceways. You can check the fit before installing the Flat Roller by designing the raceways as indicated in Fig. 1.

Table1 Example of Combinations

90°V surface		Flat surface	
Model No.	Roller diameter Da	Model No.	Roller diameter Da
FTW 4030V	2.828	FT 4030	4
FTW 4030V	2.828	FT 4035	4
FTW 5035V	3.535	FT 5038	5
FTW 5035V	3.535	FT 5043	5
FTW 5045	5	FT 10060V	7.071
FTW 5050	5	FT 10060V	7.071
FTW 10070V	7.071	FT 10080	10

Fig.1 Example of Combinations

### [Other Example of Installation]

In locations where a lifting load or an overhang load is applied, the Flat Roller can be installed as shown in Fig.2.

For details on clearance adjustment from the side face, see Example of Clearance Adjustment for the Cross Roller Guide on A-580.

Fig.2 Location where a Lifting Load is Applied

## Point of Design

### Installing the Flat Roller

#### [Determining the Flat Roller Length]

The Flat Roller travels 1/2 of the travel distance of the table in the same direction. Therefore, it is necessary to calculate the stroke length and the Flat Roller length as indicated below.

To keep the Flat Roller under the table, obtain Flat Roller length  $l_s$  as follows.

$$l_s \leq L_B - L_T$$

The Flat Roller length:

$$l = L_T + \frac{l_s}{2} = 0.5(L_B + L_T)$$

Fig.3

#### [Connecting Flat Roller Units]

When it is necessary to joint two or more Flat Roller units, use a joint plate as shown in Fig.4 to join them on the base. When placing in order, indicate the overall length for actual use.

Note, however, that model FT2010 units cannot be joined together.

Fig.4 Connection of Model FT Units

#### [Guiding the Flat Roller]

To guide model FT or FT-V, follow the instruction as shown in Fig.5.

For "b", see the specification table.

Fig.5 Guiding the Flat Roller

## Precautions on Use

## Flat Roller

### [Handling]

- (1) Disassembling components may cause dust to enter the system or degrade mounting accuracy of parts. Do not disassemble the product.
- (2) Dropping or hitting the Flat Roller may damage it. Giving an impact to the product could also cause damage to its function even if the product looks intact.

### [Contamination Protection and Lubrication]

With the Flat Roller, once foreign material enters the raceway due to poor contamination protection, it cannot be removed easily and tends to severely damage the raceway or the Flat rollers. Therefore, use much care in contamination protection. Normally, for contamination protection of the Flat Roller, a bellows or a telescopic cover that covers the whole sliding surface, as shown in Fig.1, is effective.

The required quantity of lubricant is much smaller than sliding metals, making the lubrication control easy.

Since the Flat Roller has high lubricant retention, it is suitable for grease lubrication. It is preferable to use lithium-soap group grease No. 1 or 2, or slightly viscous sliding surface oil or turbine oil.

### [Attaching the Stopper]

Although the Flat Roller performs extremely accurate motion, it may cause a traveling error due to uneven load distribution or non-uniform stop. Therefore, we recommend attaching a stopper on the end of the base or the table.

### [Chamfering the End Face of the Table]

If the Flat Roller is longer than the overall table length, finely chamfer the end face of the table so that the rollers are easily fed to the table.

(a) Copper cover or telescopic cover

(b) Bellows or roller blind

Fig.1 Contamination Protection Methods

## Precautions on Use

### [Mounting Precision]

To maximize the performance of the Flat Roller, it is necessary to distribute the load as evenly as possible when mounting the product. For the allowable tilt as shown in Fig.2, we recommend 0.1 mm or less against 1,000 mm.

Fig.2 Mounting Precision

### [Precautions on Use]

- (1) If foreign material adheres to the product, replenish the lubricant after cleaning the product.
- (2) Contact THK if you desire to use the product at a temperature of 100°C or higher.
- (3) When using the product in locations exposed to constant vibrations or in special environments such as clean rooms, vacuum and low/high temperature, contact THK in advance.
- (4) The Flat Roller cannot be used as a roller conveyor.
- (5) A moment, vertical mount, uneven contact and machine vibrations may cause the cage to slip. If slippage of the cage is inevitable, we recommend using an LM Guide system designed for infinite motion.

### [Storage]

When storing the Flat Roller, enclose it in a package designated by THK and store it while avoiding high temperature, low temperature and high humidity.

## Features and Types

## Slide Pack

### Features of the Slide Pack

Fig.1 Structure of Slide Pack Model FBW-RUU

### Structure and Features

Slide Pack model FBW is an LM system in which a precision press molded slider that contains balls performs infinite straight motion. Used in combination with a slide rail, the Slide Pack achieves light-weight and compact design and smooth straight motion at a low price.

The ball case and the slide rail are nitrided to ensure high wear resistance. (The slide rail of model FBW 2560R is made of stainless steel.)

The Slide Pack is optimal for slide units of photocopiers, tool cabinets, electronic equipment cabinets, moving seats, automatic vending machines, machine tool slide covers, cash registers, heavy doors and curtain walls.

## Features and Types

### Features of the Slide Pack

#### [Low Cost, Interchangeable]

Since it is press molded with precision, this LM system achieves stable quality and interchangeability at low cost.

#### [Infinite Stroke Length]

Unlike the conventional finite stroke type, the slider is capable of performing infinite motion. When connected with a slide rail, it can be used in long-stroke applications.

#### [Easy Installation and Handling]

Because of the structure that prevents balls from falling off even if the slider is removed from the slide rail, this model is easy to handle and can be used in a complex construction where it is impossible to install an LM system unless it is disassembled.

#### [A Type Equipped with a Contamination Protection Seal Also Standardized]

A type equipped with a contamination protection seal is standardized for locations where cutting chips or dust may enter the system.

# Types of the Slide Pack

## Type

---

### Model FBW 2560R

[Specification Table⇒B-536](#)

This model is a compact type.

### Model FBW 3590R

[Specification Table⇒B-536](#)

This model is a standard type.

### Model FBW 50110R

[Specification Table⇒B-537](#)

This model is a heavy load type.

### Model FBW 50110H

[Specification Table⇒B-537](#)

This model is a high rigidity type.

## Clearance

Model FBW is manufactured to the following accuracies.

Vertical clearance: 0.03 mm or less

Horizontal clearance: 0.1 mm or less

These specifications are values when the slide rail is attached to a rigid base.

Fig.2

## Options

## Slide Pack (Options)

### Contamination Protection

For Slide Pack model FBW-R (H), a special synthetic rubber seal with high contamination protection characteristics, capable of preventing foreign material from entering the slider and the lubricant from leaking, is available. The seal increases the contamination protection effect by contacting both the slide rail raceway where balls roll and the slide rail itself.

### Metal Dustproof Cover

For Slide Pack model FBW, steel covers that cover the whole slide rail to prevent foreign material from entering the slide are available.

For detailed dimensions, see B-538.

### Jointed Slide Rails

If the required specifications exceed the standard stroke, two or more slide rails can be connected. When placing an order, indicate the overall length.

## Installation

### [Mounting Screws of the Slide Rail]

Since the space for securing the mounting screws of the slide rail is small as shown in Fig.1, we recommend using button-head bolt or binding-head bolt (JIS B 1111 annex).

(Note) The slide rail of model FBW 50110H is countersunk. We recommend mounting the slide rail using hexagonal-socket-head type bolts (M5).

Unit: mm

Model FBW50110H

Fig.1

Model No.	t
FBW 2560R	3.2
FBW 3590R	3.4
FBW 50110R	3.4
FBW 50110H	—

### [Attaching the Stopper]

If the slider may overshoot and come off of the slide rail, attach the dedicated stopper to the slide rail end as shown in Fig.2.

Fig.2

### [Installing the Slider]

With model FBW-R (H), balls will not fall off even if the slider is removed from the slide rail. However, they could fall if the slider is twisted when reattaching it to the slide rail. Whenever possible, do not remove the slider from the slide rail when installing the Slide Pack.

### [Groove Dimensions]

Fig.3 shows the dimensions of grooves for applications where model FBW-R (H) is installed in a groove.

Unit: mm

Fig.3

Model No.	W	H
FBW 2560R	24.8 +0.15 +0.1	7.4
FBW 3590R	37 +0.15 +0.1	10
FBW 50110R	50 +0.15 +0.1	10
FBW 50110H	54.4 +0.15 +0.1	13

## Lubrication

Apply high-quality lithium soap group grease to the raceway of the slide rail before using the product.

## Precautions on Use

## Slide Pack

### [Handling]

- (1) Disassembling components may cause dust to enter the system or degrade mounting accuracy of parts. Do not disassemble the product.
- (2) Tilting the slider or slide rail may cause them to fall by their own weight.
- (3) Dropping or hitting the Slide Pack may damage it. Giving an impact to the Slide Pack could also cause damage to its function even if the product looks intact.

### [Lubrication]

- (1) Apply high-quality lithium soap group grease to the raceway of the slide rail before using the product.
- (2) Do not mix lubricants of different physical properties.

### [Precautions on Use]

- (1) The static permissible load of the Slide Pack varies according to the direction.
- (2) Entrance of foreign material may cause damage to the ball circulating component or functional loss. Prevent foreign material, such as dust or cutting chips, from entering the system.
- (3) If foreign material such as dust or cutting chips adheres to the product, replenish the lubricant after cleaning the product with pure white kerosene.
- (4) Avoid using the product at other than normal temperature, or using it in harsh conditions such as intensive reciprocations that generate frictional heat and environments with water or dust.
- (5) When using the Slide Pack with inverted mount, breakage of the slider due to an accident or the like may cause balls to fall and the slider to come off from the slide rail and fall. In these cases, take preventive measures such as adding a safety mechanism for preventing such falls.
- (6) When you remove the slider from the slide rail and then reassemble them, inserting the slide rail into the slider while twisting them may cause balls to fall or damage the slider. Be sure to gently insert the rail straight into the slider while checking the position of the slider balls and that of the rail raceway.

### [Storage]

When storing the Slide Pack, enclose it in a package designated by THK and store it while avoiding high temperature, low temperature and high humidity.

## Features and Types

## Slide Rail

### Features of the Slide Rail

Fig.1 Structure of Slide Rail Model FBL

### Structure and Features

Slide Rail model FBL is a thin, compact, lightweight and ultra-low price slide unit for finite motion. It has two rows of balls placed between an inner rail (made of a steel sheet roll-formed with precision) and an outer rail. The balls are evenly spaced by a cage press-molded with precision, thus eliminating friction between balls and achieving a smooth slide mechanism.

Since model FBL achieves smooth straight motion with easy installation, it can be used in a wide range of applications such as photocopiers, measuring instruments, telecommunication equipment, medical equipment, automatic vending machines and various types of office equipment.

#### [Unit Type That Allows Easy Installation]

Since the clearance and the motion of the slide unit are optimally adjusted, simply mounting the unit onto the base or the table using screws will achieve a slide mechanism with virtually no running noise.

#### [Thin and Compact]

Since the sectional shape is thin designed, this slide pack only requires a small side space for installation. In addition, a desired number of slide pack units can be installed in parallel according to the load conditions.

#### [Maintenance-free Operation]

Since the slide rail is treated with zinc plating, it is highly corrosion resistant. In addition, the slide unit contains lithium soap-based grease, which is highly stable against oxidation.

### Model FBL 27S-P14

[Specification Table⇒B-543](#)

An inner rail pulling type of model FBL 27S. Releasing the automatic free disconnection spring attached on the inner rail allows the slide rail to be pulled out. When stored, the spring is automatically released unidirectionally under a certain pressure.

Model FBL 27S-P14

### Model FBL 35S

[Specification Table⇒B-544](#)

A single slide type of Slide Rail with the most fundamental shape.

Model FBL 35S

## Model FBL 35M

[Specification Table⇒B-545](#)

An inner rail pulling type of model FBL 35S. It stops by frictional resistance when the slide rail is fully opened, and is pulled out when being pulled further with force. (brake-stop type)

Model FBL 35M

## Model FBL 35J

[Specification Table⇒B-546](#)

Based on model FBL 35M, this model has a lead ball that serves as a guide when the inner rail is inserted.

Model FBL 35J

## Model FBL 35J-P13

[Specification Table⇒B-547](#)

An inner rail pulling type of model FBL 35S. Releasing the disconnection spring attached on the inner rail allows the slide rail to be pulled out. When folded, the locked state with the disconnect spring is manually released.

Model FBL 35J-P13

## Model FBL 35J-P14

[Specification Table⇒B-548](#)

An inner rail pulling type of model FBL 35S. Releasing the automatic free disconnection spring attached on the inner rail allows the slide rail to be pulled out. When stored, the spring is automatically released unidirectionally under a certain pressure.

Model FBL 35J-P14

## Model FBL 35B

[Specification Table⇒B-549](#)

A brake-stop type of model FBL 35M. It can be mounted on the bottom face of a moving object when used.

Model FBL 35B

[Single Slides for Medium Load]

## Model FBL 35T

[Specification Table⇒B-550](#)

A single slide combining two units of model FBL 35S. When folded, the locked state with the disconnect spring is manually released.

Model FBL 35T

[Double Slides for Light Load]

## Model FBL 27D

[Specification Table⇒B-551](#)

A double-slide type that combines two units of model FBL 27S back-to-back. It is widely used in various types of OA equipment.

Model FBL 27D

## Model FBL 35E-P14

[Specification Table⇒B-552](#)

A three-rail, double-slide type that allows a long stroke in a small space. Releasing the automatic free disconnection spring attached on the inner rail allows the inner rail to be pulled out. When folded, the locked state is automatically released under a certain pressure in the folding direction.

Model FBL 35E-P14

## Features and Types

### Types of the Slide Rail

#### [Double Slides for Medium Load]

### Model FBL 35G-P13

A double-slide type that combines two units of model FBL 35S front-to-front. Releasing the automatic free disconnection spring attached on the inner rail allows the inner rail to be pulled out. When folded, the locked state with the disconnect spring is manually released. It is also equipped with a pull-lock mechanism that functions when the slide rail is fully opened.

[Specification Table⇒B-553](#)

Model FBL 35G-P13

### Model FBL 35G-P14

A double-slide type that combines two units of model FBL 35S front-to-front. Releasing the automatic free disconnection spring attached on the inner rail allows the inner rail to be pulled out. When folded, the lock state with the disconnect spring can automatically be released under a certain pressure in the folding direction. It is also equipped with a pull-lock mechanism that functions when the slide rail is fully opened.

[Specification Table⇒B-554](#)

Model FBL 35G-P14

### Model FBL 35D

A double-slide type that combines two units of model FBL 35S back-to-back. It is extensively used regardless of the industry.

[Specification Table⇒B-555](#)

Model FBL 35D

### Model FBL 35W

A double-slide type based on model FBL 35S that achieves a thickness of one single-slide unit.

[Specification Table⇒B-556](#)

Model FBL 35W

## Model FBL 51H

[Specification Table⇒B-557](#)

A three-rail, double-slide type that allows for a long stroke. With the smallest thickness, this model can be used in a space-saving location even under a large load.

Model FBL 51H

## Model FBL 51H-P13

[Specification Table⇒B-558](#)

A three-rail, double-slide type that allows a long stroke. With the smallest thickness, this model can be used in a space-saving location even under a large load. Releasing the automatic free disconnection spring attached on the inner rail allows the inner rail to be pulled out. When folded, the locked state with the disconnect spring is manually released. It is also equipped with a lock mechanism that functions when the slide rail is fully opened.

Model FBL 51H-P13

## Model FBL 51H-P14

[Specification Table⇒B-559](#)

A three-rail, double-slide type that allows a long stroke. With the smallest thickness, this model can be used in a space-saving location even under a large load. Releasing the automatic free disconnection spring attached on the inner rail allows the inner rail to be pulled out. When folded, the locked state is automatically released under a certain pressure in the folding direction.

Model FBL 51H-P14

**[Double Slides for Heavy Load]****Model FBL 35K**

A double-slide type combining 4 units of model FBL 35S. It achieves the largest permissible load among all types and is optimal for opening/closing heavy objects.

[Specification Table⇒B-560](#)

Model FBL 35K

**Model FBL 56H**

A double-slide type with the largest permissible load among the three rails. It is used extensively in various types of OA furniture.

[Specification Table⇒B-561](#)

Model FBL 56H

**Model FBL 56H-P13**

A double-slide type with the largest permissible load among the three rails. Releasing the automatic free disconnection spring attached on the inner rail allows the inner rail to be pulled out. When folded, the locked state with the disconnect spring is manually released. It is also equipped with a lock mechanism that functions when the slide rail is fully opened.

[Specification Table⇒B-562](#)

Model FBL 56H-P13

**Model FBL 561H-P14**

A double-slide type with the largest permissible load among the three rails. Releasing the automatic free disconnection spring attached on the inner rail allows the inner rail to be pulled out. When folded, the locked state is automatically released under a certain pressure in the folding direction.

[Specification Table⇒B-563](#)

Model FBL 561H-P14

[\[Linear Type Slides\]](#)

## Light Load Type Model FBL 35F

[Specification Table⇒B-564](#)

Using a flange type that can easily be mounted, this slide-type model is capable of performing straight, finite motion.

Light Load Type Model FBL 35F

## Medium Load Type Model FBL 56F

[Specification Table⇒B-565](#)

Using a flange type that can easily be mounted, this slide-type model is capable of performing straight, finite motion. It is optimal for locations under a large working load.

Medium Load Type Model FBL 56F

## Heavy Load Type Model FBL 48DR

[Specification Table⇒B-566](#)

A heavy-load, low-friction slide rail developed for sliding heavy doors.

Heavy Load Type Model FBL 48DR

[\[Aluminum Alloy Slide Rail\]](#)

## Light Load Type Model E15

The lightest and most compact single slide in the aluminum alloy series. It is especially suitable for locations with magnetism, locations requiring antirust measures and locations where much importance is given to appearance.

[Specification Table⇒B-567](#)

Light Load Type Model E15

## Light Load Type Model E20

A single-slide with the most fundamental shape in the aluminum alloy series. It is especially suitable for locations with magnetism, locations requiring antirust measures and locations where much importance is given to appearance.

[Specification Table⇒B-568](#)

Light Load Type Model E20

## Light Load Type Model D20

The lightest and most compact double slides in the aluminum alloy series. It is especially suitable for locations with magnetism, locations requiring antirust measures and locations where much importance is given to appearance.

Slide Rail

## Mounting Procedure and Maintenance

### Slide Rail

## Mounting the Slide Rail

### [Mounting Screws of the Slide Rail]

The slide rail is designed to be mounted using M4 screws. Since the mounting space is small as shown in Fig.1, we recommend using button-head bolt or binding-head bolt (JIS B 1111 annex).

Note) For models FBL27S/27S-P14/27D, use M4 binding-head bolt, or M3 button-head bolt or binding-head bolt.

Note) For model FBL48DR, use M5×8 mounting screw.

Note) For model E15, use M2.6 countersunk screw.

Note) For models E20 and D20, use M3 countersunk screw.

Note) For model FBL 35E, use M3 button-head bolts or binding-head bolts.

Fig.1

### [Attaching the Slide Rail]

While keeping the maximum stroke, mount the outer rail at the section where the inner rail and the outer rail overlap, slide the inner rail backward, and then secure the rail using a screw through the access hole.

Fig.2

### [Permissible Load and Mounting Orientation]

For use other than with the mounting orientation shown in Fig.3, contact THK.

The permissible load of the Slide Rail indicates the load in the direction  $P_a$  that two rails can receive in the middle of the inner rail length at the maximum stroke.

Fig.3

### [Surface Treatment]

The surface of the Slide Rail is treated with electro-galvanizing (gloss chromate treatment) as standard. Colored chromate treatment and chrome plating are also available. Contact THK for details.

## Precautions on Use

## Slide Rail

### [Handling]

- (1) Tilting a slide rail may cause it to fall by its own weight.
- (2) Dropping or hitting the Slide Rail may damage it. Giving an impact force to the slide rail could also cause damage even if the product looks intact.

### [Precautions on Use]

- (1) When mounting the Slide Rail, use care to always keep both rails in parallel.
- (2) Entrance of foreign material may cause damage to the Slide Rail or functional loss.
- (3) Avoid using the product at other than normal temperature, or using it in harsh conditions such as intensive reciprocations that generate frictional heat and environments with water or dust.
- (4) The durability of the Slide Rail varies depending on factors such as the drawing dimension, travel distance, mounting conditions and environment in addition to operating frequency. Take these factors into account when making a selection.

### [Storage]

When storing the Slide Rail, avoid high temperature, low temperature and high humidity.

## Features of the Ball Screw

### Driving Torque One Third of the Sliding Screw

With the Ball Screw, balls roll between the screw shaft and the nut to achieve high efficiency. Its required driving torque is only one third of the conventional sliding screw. (See Fig.1 and Fig.2.) As a result, it is capable of not only converting rotational motion to straight motion, but also converting straight motion to rotational motion.

Fig.1 Positive Efficiency (Rotational to Linear)

Fig.2 Reverse Efficiency (Linear to Rotational)

#### [Calculating the Lead Angle]

$$\tan\beta = \frac{Ph}{\pi \cdot d_p} \dots\dots\dots(1)$$

- β : Lead angle (°)
- d<sub>p</sub> : Ball center-to-center diameter (mm)
- Ph : Feed screw lead (mm)

**[Relationship between Thrust and Torque]**

The torque or the thrust generated when thrust or torque is applied is obtained from equations (2) to (4).

**● Driving Torque Required to Gain Thrust**

$$T = \frac{F_a \cdot Ph}{2\pi \cdot \eta_1} \dots\dots(2)$$

T : Driving torque (N-mm)

F<sub>a</sub> : Frictional resistance on the guide surface (N)

F<sub>a</sub> = μ × mg

μ : Frictional coefficient of the guide surface

g : Gravitational acceleration (9.8 m/s<sup>2</sup>)

m : Mass of the transferred object (kg)

Ph : Feed screw lead (mm)

η<sub>1</sub> : Positive efficiency of feed screw (see Fig.1 on A-664)

**● Thrust Generated When Torque is Applied**

$$F_a = \frac{2\pi \cdot \eta_1 \cdot T}{Ph} \dots\dots(3)$$

F<sub>a</sub> : Thrust generated (N)

T : Driving torque (N-mm)

Ph : Feed screw lead (mm)

η<sub>1</sub> : Positive efficiency of feed screw (see Fig.1 on A-664)

**● Torque Generated When Thrust is Applied**

$$T = \frac{Ph \cdot \eta_2 \cdot F_a}{2\pi} \dots\dots(4)$$

T : Torque generated (N-m)

F<sub>a</sub> : Thrust generated (N)

Ph : Feed screw lead (mm)

η<sub>2</sub> : Reverse efficiency of feed screw (see Fig.2 on A-664)

## [Examples of Calculating Driving Torque]

When moving an object with a mass of 500 kg using a screw with an effective diameter of 33 mm and a lead length of 10 mm (lead angle:  $5^{\circ}30'$ ), the required torque is obtained as follows.

**Rolling guide ( $\mu = 0.003$ )**

**Ball Screw (from  $\mu = 0.003$ ,  $\eta = 0.96$ )**

Frictional resistance on the guide surface

$$F_a = 0.003 \times 500 \times 9.8 = 14.7 \text{ N}$$

Driving torque

$$T = \frac{14.7 \times 10}{2\pi \times 0.96} = 24 \text{ N} \cdot \text{mm}$$

**Rolling guide ( $\mu = 0.003$ )**

**Ball Screw (from  $\mu = 0.2$ ,  $\eta = 0.32$ )**

Frictional resistance on the guide surface

$$F_a = 0.003 \times 500 \times 9.8 = 14.7 \text{ N}$$

Driving torque

$$T = \frac{14.7 \times 10}{2\pi \times 0.32} = 73 \text{ N} \cdot \text{mm}$$

## Ensuring High Accuracy

The Ball Screw is ground with the highest-level facilities and equipment at a strictly temperature-controlled factory, Its accuracy is assured under a thorough quality control system that covers assembly to inspection.

Automatic lead-measuring machine using laser

Fig.3 Lead Accuracy Measurement

[Conditions]

Model No.: BIF3205-10RRG0+903LC2

Table1 Lead Accuracy Measurement Unit: mm

Item	Standard value	Actual measurement
Directional target point	0	—
Representative travel distance error	±0.011	-0.0012
Fluctuation	0.008	0.0017

## Capable of Micro Feeding

The Ball Screw requires a minimal starting torque due to its rolling motion, and does not cause a slip, which is inevitable with a sliding motion. Therefore, it is capable of an accurate micro feeding.

Fig.4 shows a travel distance of the Ball Screw in one-pulse,  $0.1\text{-}\mu\text{m}$  feeding. (LM Guide is used for the guide surface.)

Fig.4 Data on Travel in  $0.1\text{-}\mu\text{m}$  Feeding

## High Rigidity without Backlash

Since the Ball Screw is capable of receiving a preload, the axial clearance can be reduced to below zero and the high rigidity is achieved because of the preload. In Fig.5, when an axial load is applied in the positive (+) direction, the table is displaced in the same (+) direction. When an axial load is provided in the reverse (-) direction, the table is displaced in the same (-) direction. Fig.6 shows the relationship between the axial load and the axial displacement. As indicated in Fig.6, as the direction of the axial load changes, the axial clearance occurs as a displacement. Additionally, when the Ball Screw is provided with a preload, it gains a higher rigidity and a smaller axial displacement than a zero clearance in the axial direction.

Fig.5

Fig.6 Axial Displacement in Relation to Axial Load

## Capable of Fast Feed

Since the Ball Screw is highly efficient and generates little heat, it is capable of a fast feed.

### [Example of High Speed]

Fig.7 shows a speed diagram for a large lead rolled Ball Screw operating at 2 m/s.

[Conditions]

Item	Description
Sample	Large Lead Rolled Ball Screw WTF3060 (Shaft diameter: 30mm; lead: 60mm)
Maximum speed	2m/s (Ball Screw rotational speed: 2,000 min <sup>-1</sup> )
Guide surface	LM Guide model SR25W

Fig.7 Velocity diagram

**[Example of Heat Generation]**

Fig.8 shows data on heat generation from the screw shaft when a Ball Screw is used in an operating pattern indicated in Fig.9

[Conditions]

Item	Description
Sample	Double-nut precision Ball Screw BNFN4010-5 (Shaft diameter: 40 mm; lead: 10 mm; applied preload: 2,700 N)
Maximum speed	0.217m/s (13m/min) (Ball Screw rotational speed: 1300 min <sup>-1</sup> )
Low speed	0.0042m/s (0.25m/min) (Ball Screw rotational speed: 25 min <sup>-1</sup> )
Guide surface	LM Guide model HSR35CA
Lubricant	Lithium-based grease (No. 2)

## Flowchart for Selecting a Ball Screw

### [Ball Screw Selection Procedure]

When selecting a Ball Screw, it is necessary to make a selection while considering various parameters. The following is a flowchart for selecting a Ball Screw.

Point of Selection

Flowchart for Selecting a Ball Screw

Ball Screw

### [Conditions of the Ball Screw]

The following conditions are required when selecting a Ball Screw.

Transfer orientation	(horizontal, vertical, etc.)
Transferred mass	m (kg)
Table guide method	(sliding, rolling)
Frictional coefficient of the guide surface	$\mu$ (-)
Guide surface resistance	f (N)
External load in the axial direction	F (N)
Desired service life time	$L_r$ (h)

Stroke length	$l_s$ (mm)
Operating speed	$V_{max}$ (m/s)
Acceleration time	$t_1$ (s)
Even speed time	$t_2$ (s)
Deceleration time	$t_3$ (s)

Acceleration  $\alpha = \frac{V_{max}}{t_1}$  (m/s<sup>2</sup>)

Acceleration distance	$l_1 = V_{max} \times t_1 \times 1000/2$ (mm)
Even speed distance	$l_2 = V_{max} \times t_2 \times 1000$ (mm)
Deceleration distance	$l_3 = V_{max} \times t_3 \times 1000/2$ (mm)
Number of reciprocations per minute	n (min <sup>-1</sup> )

Positioning accuracy	(mm)
Positioning accuracy repeatability	(mm)
Backlash	(mm)
Minimum feed amount	s (mm/pulse)

Driving motor (AC servomotor, stepping motor, etc.)

The rated rotational speed of the motor	$N_{MO}$ (min <sup>-1</sup> )
Inertial moment of the motor	$J_M$ (kg · m <sup>2</sup> )
Motor resolution	(pulse/rev)
Reduction ratio	A (-)

# Accuracy of the Ball Screw

## Lead Angle Accuracy

The accuracy of the Ball Screw in the lead angle is controlled in accordance with the JIS standards (JIS B 1192 - 1997).

Accuracy grades C0 to C5 are defined in the linearity and the directional property, and C7 to C10 in the travel distance error in relation to 300 mm.

Fig.1 Terms on Lead Angle Accuracy

### [Actual Travel Distance]

An error in the travel distance measured with an actual Ball Screw.

### [Reference Travel Distance]

Generally, it is the same as nominal travel distance, but can be an intentionally corrected value of the nominal travel distance according to the intended use.

### [Target Value for Reference Travel Distance]

You may provide some tension in order to prevent the screw shaft from runout, or set the reference travel distance in "negative" or "positive" value in advance given the possible expansion/contraction from external load or temperature. In such cases, indicate a target value for the reference travel distance.

### [Representative Travel Distance]

It is a straight line representing the tendency in the actual travel distance, and obtained with the least squares method from the curve that indicates the actual travel distance.

### [Representative Travel Distance Error (in $\pm$ )]

Difference between the representative travel distance and the reference travel distance.

### [Fluctuation]

The maximum width of the actual travel distance between two straight lines drawn in parallel with the representative travel distance.

### [Fluctuation/300]

Indicates a fluctuation against a given thread length of 300 mm.

### [Fluctuation/2 $\pi$ ]

A fluctuation in one revolution of the screw shaft.

Table3 Types and Grades

Type	Series symbol	Grade	Remarks
For positioning	Cp	1, 3, 5	ISO compliant
For conveyance	Ct	1, 3, 5, 7, 10	

Note) Accuracy grades apply also to the Cp series and Ct series. Contact THK for details.

Example: When the lead of a Ball Screw manufactured is measured with a target value for the reference travel distance of  $-9 \mu\text{m}/500 \text{ mm}$ , the following data are obtained.

Table4 Measurement Data on Travel Distance Error

Unit: mm

Command position (A)	0	50	100	150
Travel distance (B)	0	49.998	100.001	149.996
Travel distance error (A-B)	0	-0.002	+0.001	-0.004

Command position (A)	200	250	300	350
Travel distance (B)	199.995	249.993	299.989	349.885
Travel distance error (A-B)	-0.005	-0.007	-0.011	-0.015

Command position (A)	400	450	500
Travel distance (B)	399.983	449.981	499.984
Travel distance error (A-B)	-0.017	-0.019	-0.016

The measurement data are expressed in a graph as shown in Fig.2.

The positioning error (A-B) is indicated as the actual travel distance while the straight line representing the tendency of the (A-B) graph refers to the representative travel distance.

The difference between the reference travel distance and the representative travel distance appears as the representative travel distance error.

Fig.2 Measurement Data on Travel Distance Error

[Measurements]

Representative travel distance error:  $-7 \mu\text{m}$

Fluctuation:  $8.8 \mu\text{m}$

## Accuracy of the Mounting Surface

The accuracy of the Ball Screw mounting surface complies with the JIS standard (JIS B 1192-1997).

Note) For the overall radial runout of the screw shaft axis, refer to JIS B 1192-1997.

dammu

Fig.3 Accuracy of the Mounting Surface of the Ball Screw

**[Accuracy Standards for the Mounting Surface]**

Table5 to Table9 show accuracy standards for the mounting surfaces of the precision Ball Screw.

Table5 Radial Runout of the Circumference of the Thread Root in Relation to the Supporting Portion Axis of the Screw Shaft  
Unit: μm

Screw shaft outer diameter (mm)		Runout (maximum)					
Above	Or less	C0	C1	C2	C3	C5	C7
—	8	3	5	7	8	10	14
8	12	4	5	7	8	11	14
12	20	4	6	8	9	12	14
20	32	5	7	9	10	13	20
32	50	6	8	10	12	15	20
50	80	7	9	11	13	17	20
80	100	—	10	12	15	20	30

Note) The measurements on these items include the effect of the runout of the screw shaft diameter. Therefore, it is necessary to obtain the correction value from the overall runout of the screw shaft axis, using the ratio of the distance between the fulcrum and measurement point to the overall screw shaft length, and add the obtained value to the table above.

Example: model No. DIK2005-6RRGO+500LC5

**$E_1 = e + \Delta e$**

e : Standard value in Table5 (0.012)

$\Delta e$  : Correction value

**$\Delta e = \frac{L_1}{L} \times E_2$**

$= \frac{80}{500} \times 0.06$

$= 0.01$

$E_1 = 0.012 + 0.01$

$= 0.022$

$E_2$  : Overall radial runout of the screw shaft axis (0.06)

Table6 Perpendicularity of the Supporting Portion End of the Screw Shaft to the Supporting Portion Axis

160	200	—	16	20	25	34	50

Table9 Parallelism of the Nut Circumference (Flat Mounting Surface) to the Screw Shaft Axis

Unit:  $\mu\text{m}$

Mounting reference length (mm)		Parallelism (maximum)					
Above	Or less	C0	C1	C2	C3	C5	C7
—	50	5	6	7	8	10	17
50	100	7	8	9	10	13	17
100	200	—	10	11	13	17	30

**[Method for Measuring Accuracy of the Mounting Surface]**

**● Radial Runout of the Circumference of the Part Mounting Section in Relation to the Supporting Portion Axis of the Screw Shaft (see Table5 on A-681)**

Support the supporting portion of the screw shaft with V blocks. Place a probe on the circumference of the part mounting section, and read the largest difference on the dial gauge as a measurement when turning the screw shaft by one revolution.

● **Radial Runout of the Circumference of the Thread Root in Relation to the Supporting Portion Axis of the Screw Shaft (see Table5 on A-681)**

Support the supporting portion of the screw shaft with V blocks. Place a probe on the circumference of the nut, and read the largest difference on the dial gauge as a measurement when turning the screw shaft by one revolution without turning the nut.

● **Perpendicularity of the Supporting Portion End of the Screw Shaft to the Supporting Portion Axis (see Table6 on A-682)**

Support the supporting portion of the screw shaft with V blocks. Place a probe on the screw shaft's supporting portion end, and read the largest difference on the dial gauge as a measurement when turning the screw shaft by one revolution.

● **Perpendicularity of the Flange Mounting Surface of the Screw Shaft to the Screw Shaft Axis (see Table7 on A-682)**

Support the thread of the screw shaft with V blocks near the nut. Place a probe on the flange end, and read the largest difference on the dial gauge as a measurement when simultaneously turning the screw shaft and the nut by one revolution.

● **Radial Runout of the Nut Circumference in Relation to the Screw Shaft Axis (see Table8 on A-682)**

Support the thread of the screw shaft with V blocks near the nut. Place a probe on the circumference of the nut, and read the largest difference on the dial gauge as a measurement when turning the nut by one revolution without turning the screw shaft.

● **Parallelism of the Nut Circumference (Flat Mounting Surface) to the Screw Shaft Axis (see Table9 on A-682)**

Support the thread of the screw shaft with V blocks near the nut. Place a probe on the circumference of the nut (flat mounting surface), and read the largest difference on the dial gauge as a measurement when moving the dial gauge in parallel with the screw shaft.

● **Overall Radial Runout of the Screw Shaft Axis**

Support the supporting portion of the screw shaft with V blocks. Place a probe on the circumference of the screw shaft, and read the largest difference on the dial gauge at several points in the axial directions as a measurement when turning the screw shaft by one revolution.

Note) For the overall radial runout of the screw shaft axis, refer to JIS B 1192-1997.

## Axial Clearance

### [Axial Clearance of the Precision Ball Screw]

Table10 shows the axial clearance of the precision Screw Ball. If the manufacturing length exceeds the value in Table11, the resultant clearance may partially be negative (preload applied).

Table10 Axial Clearance of the Precision Ball Screw

Unit: mm

Clearance symbol	G0	GT	G1	G2	G3
Axial clearance	0 or less	0 to 0.005	0 to 0.01	0 to 0.02	0 to 0.05

Table11 Maximum Length of the Precision Ball Screw in Axial Clearance

Unit: mm

Screw shaft outer diameter	Overall thread length						
	Clearance GT		Clearance G1		Clearance G2		
	C0 to C3	C5	C0 to C3	C5	C0 to C3	C5	C7
4 to 6	80	100	80	100	80	100	120
8 to 10	250	200	250	250	250	300	300
12 to 16	500	400	500	500	700	600	500
18 to 25	800	700	800	700	1000	1000	1000
28 to 32	900	800	1100	900	1400	1200	1200
36 to 45	1000	800	1300	1000	2000	1500	1500
50 to 70	1200	1000	1600	1300	2500	2000	2000
80 to 100	—	—	1800	1500	4000	3000	3000

\* When manufacturing the Ball Screw of precision-grade accuracy C7 with clearance GT or G1, the resultant clearance is partially negative.

### [Axial Clearance of the Rolled Ball Screw]

Table12 shows axial clearance of the rolled Ball Screw.

Table12 Axial Clearance of the Rolled Ball Screw

Unit: mm

Screw shaft outer diameter	Axial clearance (maximum)
6 to 12	0.05
14 to 28	0.1
30 to 32	0.14
36 to 45	0.17
50	0.2

## Preload

A preload is provided in order to eliminate the axial clearance and minimize the displacement under an axial load.

When performing a highly accurate positioning, a preload is generally provided.

### [Rigidity of the Ball Screw under a Preload]

When a preload is provided to the Ball Screw, the rigidity of the nut is increased.

Fig.4 shows elastic displacement curves of the Ball Screw under a preload and without a preload.

Fig.4 Elastic Displacement Curve of the Ball Screw

dammy

Fig.5 shows a double-nut type of the Ball Screw.

Nuts A and B are provided with preload  $F_{a_0}$  from the spacer. Because of the preload, nuts A and B are elastically displaced by  $\delta_{a_0}$  each. If an axial load ( $F_a$ ) is applied from outside in this state, the displacement of nuts A and B is calculated as follows.

$$\delta_A = \delta_{a_0} + \delta_a \quad \delta_B = \delta_{a_0} - \delta_a$$

In other words, the loads on nut A and B are expressed as follows:

$$F_A = F_{a_0} + (F_a - F_a') \quad F_B = F_{a_0} - F_a'$$

Therefore, under a preload, the load that nut A receives equals to  $F_a - F_a'$ . This means that since load  $F_a'$ , which is applied when nut A receives no preload, is deducted from  $F_a$ , the displacement of nut A is smaller.

This effect extends to the point where the displacement ( $\delta_{a_0}$ ) caused by the preload applied on nut B reaches zero.

To what extent is the elastic displacement reduced? The relationship between the axial load on the Ball Screw under no preload and the elastic displacement can be expressed by  $\delta_a \propto F_a^{2/3}$ . From Fig.6, the following equations are established.

$$\delta_{a_0} = K F_{a_0}^{2/3} \quad (K : \text{constant})$$

$$2\delta_{a_0} = K F_t^{2/3}$$

$$\left(\frac{F_t}{F_{a_0}}\right)^{2/3} = 2 \quad F_t = 2^{3/2} \times F_{a_0} = 2.8F_{a_0} \approx 3F_{a_0}$$

Thus, the Ball Screw under a preload is displaced by  $\delta_{a_0}$  when an axial load ( $F_t$ ) approximately three times greater than the preload is provided from outside. As a result, the displacement of the Ball Screw under a preload is half the displacement ( $2\delta_{a_0}$ ) of the Ball Screw without a preload.

As stated above, since the preloading is effective up to approximately three times the applied preload, the optimum preload is one third of the maximum axial load.

Note, however, that an excessive preload adversely affects the service life and heat generation. As a guideline, the maximum preload should be set at 10% of the basic dynamic load rating ( $C_a$ ) at a maximum.

**[Preload Torque]**

The preload torque of the Ball Screw in lead is controlled in accordance with the JIS standard (JIS B 1192-1997).

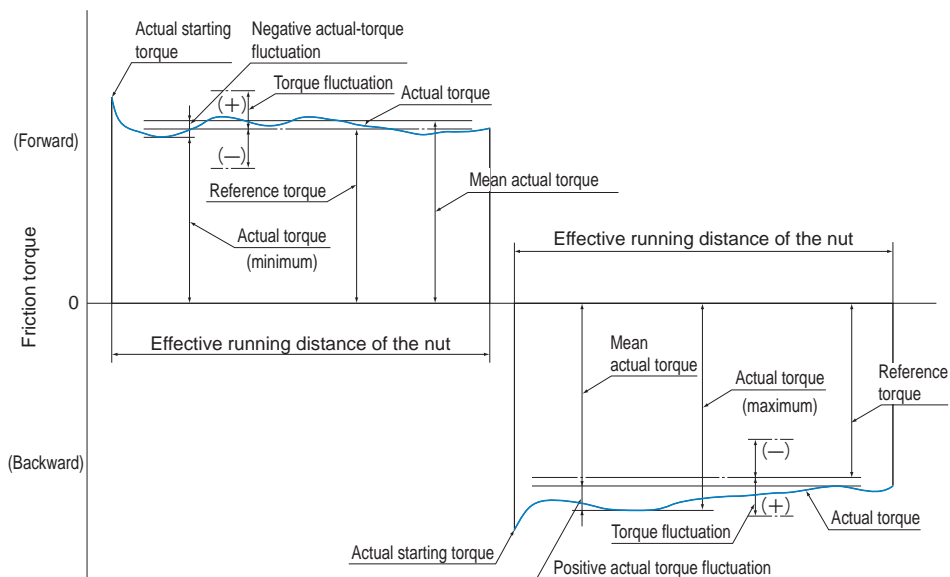

Fig.7 Terms on Preload Torque

● **Dynamic Preload Torque**

A torque required to continuously rotate the screw shaft of a Ball Screw under a given preload without an external load applied.

● **Actual Torque**

A dynamic preload torque measured with an actual Ball Screw.

● **Torque Fluctuation**

Variation in a dynamic preload torque set at a target value. It can be positive or negative in relation to the reference torque.

● **Coefficient of Torque Fluctuation**

Ratio of torque fluctuation to the reference torque.

● **Reference Torque**

A dynamic preload torque set as a target.

● **Calculating the Reference Torque**

The reference torque of a Ball Screw provided with a preload is obtained in the following equation (5).

$$T_p = 0.05 (\tan\beta)^{-0.5} \frac{F_{a0} \cdot Ph}{2\pi} \dots\dots(5)$$

- $T_p$  : Reference torque (N·mm)
- $\beta$  : Lead angle
- $F_{a0}$  : Applied preload (N)
- $Ph$  : Lead (mm)

Example: When a preload of 3,000 N is provided to the Ball Screw model BNFN4010-5G0 + 1500LC3 with a thread length of 1,300 mm (shaft diameter: 40 mm; ball center-to-center diameter: 41.75 mm; lead: 10 mm), the preload torque of the Ball Screw is calculated in the steps below.

**■Calculating the Reference Torque**

$\beta$  : Lead angle

$$\tan\beta = \frac{\text{lead}}{\pi \times \text{ball center-to-center diameter}} = \frac{10}{\pi \times 41.75} = 0.0762$$

$F_{a0}$  : Applied preload=3000N

$P_h$  : Lead = 10mm

$$T_p = 0.05 (\tan\beta)^{-0.5} \frac{F_{a0} \cdot P_h}{2\pi} = 0.05 (0.0762)^{-0.5} \frac{3000 \times 10}{2\pi} = 865 \text{ N} \cdot \text{mm}$$

**■Calculating the Torque Fluctuation**

$$\frac{\text{thread length}}{\text{screw shaft outer diameter}} = \frac{1300}{40} = 32.5 \leq 40$$

Thus, with the reference torque in Table13 being between 600 and 1,000 N·mm, effective thread length 4,000 mm or less and accuracy grade C3, the coefficient of torque fluctuation is obtained as  $\pm 30\%$ .

As a result, the torque fluctuation is calculated as follows.

$$865 \times (1 \pm 0.3) = 606 \text{ N} \cdot \text{mm to } 1125 \text{ N} \cdot \text{mm}$$

**■Result**

Reference torque : 865 N·mm

Torque fluctuation : 606 N·mm to 1125 N·mm

Table13 Tolerance Range in Torque Fluctuation

## Selecting a Screw Shaft

### Maximum Length of the Screw Shaft

The maximum length of the precision Ball Screw and the rolled Ball Screw are shown in Table14 and Table15 (A-691) respectively.

If the shaft dimensions exceed the manufacturing limit in Table14 or Table15, contact THK.

Table14 Maximum Length of the Precision Ball Screw by Accuracy Grade

Unit: mm

Screw shaft outer diameter	Overall screw shaft length

Ball Screw

## Permissible Axial Load

### [Buckling Load on the Screw Shaft]

With the Ball Screw, it is necessary to select a screw shaft so that it will not buckle when the maximum compressive load is applied in the axial direction.

Fig.8 on A-695 shows the relationship between the screw shaft diameter and a buckling load.

If determining a buckling load by calculation, it can be obtained from the equation (6) below. Note that in this equation, a safety factor of 0.5 is multiplied to the result.

$$P_1 = \frac{\eta_1 \cdot \pi^2 \cdot E \cdot I}{l_a^2} \cdot 0.5 = \eta_2 \frac{d_1^4}{l_a^2} \cdot 10^4 \dots\dots\dots(6)$$

$P_1$  : Buckling load (N)

$l_a$  : Distance between two mounting surfaces (mm)

$E$  : Young's modulus ( $2.06 \times 10^5$  N/mm<sup>2</sup>)

$I$  : Minimum geometrical moment of inertia of the shaft (mm<sup>4</sup>)

$$I = \frac{\pi}{64} d_1^4 \quad d_1: \text{screw-shaft thread minor diameter (mm)}$$

$\eta_1, \eta_2$ =Factor according to the mounting method

Fixed - free       $\eta_1=0.25$        $\eta_2=1.3$

Fixed - supported  $\eta_1=2$        $\eta_2=10$

Fixed - fixed       $\eta_1=4$        $\eta_2=20$

### [Permissible Tensile Compressive Load on the Screw Shaft]

If an axial load is applied to the Ball Screw, it is necessary to take into account not only the buckling load but also the permissible tensile compressive load in relation to the yielding stress on the screw shaft.

The permissible tensile compressive load is obtained from the equation (7).

$$P_2 = \sigma \frac{\pi}{4} d_1^2 = 116d_1^2 \dots\dots\dots(7)$$

$P_2$  : Permissible tensile compressive load (N)

$\sigma$  : Permissible tensile compressive stress (147 MPa)

$d_1$  : Screw-shaft thread minor diameter (mm)

Fig.8 Permissible Tensile Compressive Load Diagram

## Permissible Rotational Speed

### [Dangerous Speed of the Screw Shaft]

When the rotational speed reaches a high magnitude, the Ball Screw may resonate and eventually become unable to operate due to the screw shaft's natural frequency. Therefore, it is necessary to select a model so that it is used below the resonance point (dangerous speed).

Fig.9 on A-698 shows the relationship between the screw shaft diameter and a dangerous speed.

If determining a dangerous speed by calculation, it can be obtained from the equation (8) below. Note that in this equation, a safety factor of 0.8 is multiplied to the result.

$$N_1 = \frac{60 \cdot \lambda_1^2}{2\pi \cdot \ell_b^2} \times \sqrt{\frac{E \times 10^3 \cdot I}{\gamma \cdot A}} \times 0.8 = \lambda_2 \cdot \frac{d_1}{\ell_b^2} \cdot 10^7 \dots\dots(8)$$

$N_1$  : Permissible rotational speed determined  
by dangerous speed (min<sup>-1</sup>)

$\ell_b$  : Distance between two mounting  
surfaces (mm)

$E$  : Young's modulus (2.06 × 10<sup>5</sup> N/mm<sup>2</sup>)

$I$  : Minimum geometrical moment of inertia  
of the shaft (mm<sup>4</sup>)

$$I = \frac{\pi}{64} d_1^4 \quad d_1: \text{screw-shaft thread minor diameter (mm)}$$

$\gamma$  : Density (specific gravity)  
(7.85 × 10<sup>-6</sup> kg/mm<sup>3</sup>)

$A$  : Screw shaft cross-sectional area (mm<sup>2</sup>)

$$A = \frac{\pi}{4} d_1^2$$

$\lambda_1, \lambda_2$  : Factor according to the mounting method

Fixed - free             $\lambda_1=1.875$      $\lambda_2=3.4$

Supported - supported  $\lambda_1=3.142$     $\lambda_2=9.7$

Fixed - supported     $\lambda_1=3.927$     $\lambda_2=15.1$

Fixed - fixed          $\lambda_1=4.73$       $\lambda_2=21.9$

**[DN Value]**

The permissible rotational speed of the Ball Screw must be obtained from the dangerous speed of the screw shaft and the DN value.

The permissible rotational speed determined by the DN value is obtained using the equations (9) to (13) below.

- **Ball Screw with Ball Cage**

- **Models SBN and HBN**

$$N_2 = \frac{130000}{D} \dots\dots\dots(9)$$

$N_2$  : Permissible rotational speed determined by the DN value (min<sup>-1</sup>(rpm))

$D$  : Ball center-to-center diameter

(indicated in the specification tables of the respective model number)

- **Model SBK**

$$N_2 = \frac{160000}{D} \dots\dots\dots(10)$$

- **Precision Ball Screw**

$$N_2 = \frac{70000}{D} \dots\dots\dots(11)$$

- **Rolled Ball Screw**

(excluding large lead type)

$$N_2 = \frac{50000}{D} \dots\dots\dots(12)$$

- **Large-Lead Rolled Ball Screw**

$$N_2 = \frac{70000}{D} \dots\dots\dots(13)$$

Of the permissible rotational speed determined by dangerous speed ( $N_1$ ) and the permissible rotational speed determined by DN value ( $N_2$ ), the lower rotational speed is regarded as the permissible rotational speed.

If the working rotational speed exceeds  $N_2$ , a high-speed type Ball Screw is available. Contact THK for details.

Fig.9 Permissible Rotational Speed Diagram

# Selecting a Nut

## Types of Nuts

The nuts of the Ball Screws are categorized by the ball circulation method into the return-pipe type, the deflector type and end the cap type. These three nut types are described as follows.

In addition to the circulation methods, the Ball Screws are categorized also by the preloading method.

### [Types by Ball Circulation Method]

#### ● Return-pipe Type

(Models SBN, BNF, BNT, BNFN, BIF and BTK)

##### Return-piece Type (Model HBN)

These are most common types of nuts that use a return pipe for ball circulation. The return pipe allows balls to be picked up, pass through the pipe, and return to their original positions to complete infinite motion.

Example of Structure of Return-Pipe Nut

#### ● Deflector Type

(Models DK, DKN, DIK, JPF and DIR)

These are the most compact type of nut. The balls change their traveling direction with a deflector, pass over the circumference of the screw shaft, and return to their original positions to complete an infinite motion.

Example of Structure of Simple Nut

#### ● End-cap Type: Large lead Nut

(Models SBK, BLK, WGF, BLW, WTF, CNF and BLR)

These nuts are most suitable for the fast feed. The balls are picked up with an end cap, pass through the through hole of the nut, and return to their original positions to complete an infinite motion.

Example of Structure of Large lead Nut

### [Types by Preloading Method]

#### ● Fixed-point Preloading

#### ■ Double-nut Preload (Models BNFN, DKN and BLW)

A spacer is inserted between two nuts to provide a preload.

Model BNFN

Model DKN

Model BLW

#### ■ Offset Preload (Models SBN, BIF, DIK, SBK and DIR)

More compact than the double-nut method, the offset preloading provides a preload by changing the groove pitch of the nut without using a spacer.

Model SBN

Model BIF

Model DIK

Model SBK

Model DIR

### ● Constant Pressure Preloading (Model JPF)

With this method, a spring structure is installed almost in the middle of the nut, and it provides a preload by changing the groove pitch in the middle of the nut.

Model JPF

# Selecting a Model Number

## Calculating the Axial Load

### [In Horizontal Mount]

With ordinary conveyance systems, the axial load ( $F_{a_n}$ ) applied when horizontally reciprocating the work is obtained in the equation below.

$$Fa_1 = \mu \cdot mg + f + m\alpha \dots\dots\dots (14)$$

$$Fa_2 = \mu \cdot mg + f \dots\dots\dots (15)$$

$$Fa_3 = \mu \cdot mg + f - m\alpha \dots\dots\dots (16)$$

$$Fa_4 = -\mu \cdot mg - f - m\alpha \dots\dots\dots (17)$$

$$Fa_5 = -\mu \cdot mg - f \dots\dots\dots (18)$$

$$Fa_6 = -\mu \cdot mg - f + m\alpha \dots\dots\dots (19)$$

$V_{max}$  : Maximum speed (m/s)

$t_1$  : Acceleration time (m/s)

$$\alpha = \frac{V_{max}}{t_1} : \text{Acceleration} \quad (m/s^2)$$

$Fa_1$  : Axial load during forward acceleration (N)

$Fa_2$  : Axial load during forward uniform motion (N)

$Fa_3$  : Axial load during forward deceleration (N)

$Fa_4$  : Axial load during backward acceleration (N)

$Fa_5$  : Axial load during uniform backward motion (N)

$Fa_6$  : Axial load during backward deceleration (N)

$m$  : Transferred mass (kg)

$\mu$  : Frictional coefficient of the guide surface (-)

$f$  : Guide surface resistance (without load) (N)

### [In Vertical Mount]

With ordinary conveyance systems, the axial load ( $F_{a_n}$ ) applied when vertically reciprocating the work is obtained in the equation below.

$$Fa_1 = mg + f + m\alpha \dots\dots\dots (20)$$

$$Fa_2 = mg + f \dots\dots\dots (21)$$

$$Fa_3 = mg + f - m\alpha \dots\dots\dots (22)$$

$$Fa_4 = mg - f - m\alpha \dots\dots\dots (23)$$

$$Fa_5 = mg - f \dots\dots\dots (24)$$

$$Fa_6 = mg - f + m\alpha \dots\dots\dots (25)$$

$V_{max}$  : Maximum speed (m/s)

$t_1$  : Acceleration time (m/s)

$$\alpha = \frac{V_{max}}{t_1} : \text{Acceleration} \quad (m/s^2)$$

$Fa_1$  : Axial load during upward acceleration (N)

$Fa_2$  : Axial load during uniform upward motion (N)

$Fa_3$  : Axial load during upward deceleration (N)

$Fa_4$  : Axial load during downward acceleration (N)

$Fa_5$  : Axial load during uniform downward motion (N)

$Fa_6$  : Axial load during downward deceleration (N)

$m$  : Transferred mass (kg)

$f$  : Guide surface resistance (without load) (N)

## Static Safety Factor

The basic static load rating ( $C_{0a}$ ) generally equals to the permissible axial load of a Ball Screw. Depending on the conditions, it is necessary to take into account the following static safety factor against the calculated load. When the Ball Screw is stationary or in motion, unexpected external force may be applied through an inertia caused by the impact or the start and stop.

$$F_{a_{max}} = \frac{C_{0a}}{f_s} \dots\dots\dots(26)$$

$F_{a_{max}}$  : Permissible Axial Load (kN)

$C_{0a}$  : Basic static load rating\* (kN)

$f_s$  : Static safety factor (see Table18)

Table18 Static Safety Factor ( $f_s$ )

Machine using the LM system	Load conditions	Lower limit of $f_s$
General industrial machinery	Without vibration or impact	1 to 1.3
	With vibration or impact	2 to 3
Machine tool	Without vibration or impact	1 to 1.5
	With vibration or impact	2.5 to 7

The basic static load rating ( $C_{0a}$ ) is a static load with a constant direction and magnitude whereby the sum of the permanent deformation of the rolling element and that of the raceway on the contact area under the maximum stress is 0.0001 times the rolling element diameter. With the Ball Screw, it is defined as the axial load. (Specific values of each Ball Screw model are indicated in the specification tables for the corresponding model number.)

## Studying the Service Life

### [Service Life of the Ball Screw]

The Ball Screw in motion under an external load receives the continuous stress on its raceways and balls. When the stress reaches the limit, the raceways break from the fatigue and their surfaces partially disintegrate in scale-like pieces. This phenomenon is called flaking. The service life of the Ball Screw is the total number of revolutions until the first flaking occurs on any of the raceways or the balls as a result of the rolling fatigue of the material.

The service life of the Ball Screw varies from unit to unit even if they are manufactured in the same process and used in the same operating conditions. For this reason, when determining the service life of a Ball Screw unit, the nominal life as defined below is used as a guideline.

The nominal life is the total number of revolutions that 90% of identical Ball Screw units in a group achieve without developing flaking (scale-like pieces of a metal surface) after they independently operate in the same conditions.

### [Calculating the Rated Life]

The service life of the Ball Screw is calculated from the equation (27) below using the basic dynamic load rating ( $C_a$ ) and the applied axial load.

#### ● Nominal Life (Total Number of Revolutions)

$$L = \left( \frac{C_a}{f_w \cdot F_a} \right)^3 \times 10^6 \dots\dots\dots(27)$$

L : Nominal life (rev)  
(total number of revolutions)

$C_a$  : Basic dynamic load rating\* (N)

$F_a$  : Applied axial load (N)

$f_w$  : Load factor (see Table19)

Table19 Load Factor ( $f_w$ )

Vibrations/ impact	Speed(V)	$f_w$
Faint	Very low $V \leq 0.25\text{m/s}$	1 to 1.2
Weak	Slow $0.25 < V \leq 1\text{m/s}$	1.2 to 1.5
Medium	Medium $1 < V \leq 2\text{m/s}$	1.5 to 2
Strong	High $V > 2\text{m/s}$	2 to 3.5

\* The basic dynamic load rating ( $C_a$ ) is used in calculating the service life when a Ball Screw operates under a load. The basic dynamic load rating is a load with interlocked direction and magnitude under which the nominal life (L) equals to  $10^6$ rev. when a group of the same Ball Screw units independently operate. (Specific basic dynamic load ratings ( $C_a$ ) are indicated in the specification tables of the corresponding model numbers.)

### ● Service Life Time

If the revolutions per minute is determined, the service life time can be calculated from the equation (28) below using the nominal life (L).

$$L_h = \frac{L}{60 \times N} = \frac{L \times Ph}{2 \times 60 \times n \times l_s} \dots\dots\dots(28)$$

- $L_h$  : Service life time (h)  
 $N$  : Revolutions per minute ( $\text{min}^{-1}$ )  
 $n$  : Number of reciprocations per minute ( $\text{min}^{-1}$ )  
 $Ph$  : Ball Screw lead (mm)  
 $l_s$  : Stroke length (mm)

### ● Service Life in Travel Distance

The service life in travel distance can be calculated from the equation (29) below using the nominal life (L) and the Ball Screw lead.

$$L_s = \frac{L \times Ph}{10^6} \dots\dots\dots(29)$$

- $L_s$  : Service Life in Travel Distance (km)  
 $Ph$  : Ball Screw lead (mm)

### ● Applied Load and Service Life with a Preload Taken into Account

If the Ball Screw is used under a preload (medium preload), it is necessary to consider the applied preload in calculating the service life since the ball screw nut already receives an internal load. For details on applied preload for a specific model number, contact THK.

### ● Average Axial Load

If an axial load acting on the Ball Screw is present, it is necessary to calculate the service life by determining the average axial load.

The average axial load ( $F_m$ ) is a constant load that equals to the service life in fluctuating the load conditions.

If the load changes in steps, the average axial load can be obtained from the equation below.

$$F_m = \sqrt[3]{\frac{1}{l} (Fa_1^3 l_1 + Fa_2^3 l_2 + \dots + Fa_n^3 l_n)} \dots\dots\dots(30)$$

- $F_m$  : Average Axial Load (N)  
 $Fa_n$  : Varying load (N)  
 $l_n$  : Distance traveled under load ( $F_n$ )  
 $l$  : Total travel distance

To determine the average axial load using a rotational speed and time, instead of a distance, calculate the average axial load by determining the distance in the equation below.

$$l = l_1 + l_2 + \dots + l_n$$

$$l_1 = N_1 \cdot t_1$$

$$l_2 = N_2 \cdot t_2$$

$$l_n = N_n \cdot t_n$$

N: Rotational speed

t: Time

### ■When the Applied Load Sign Changes

When all signs for fluctuating loads are the same, the equation (30) applies without problem. However, if the sign for the fluctuating load changes according to the operation, it is necessary to calculate both the average axial load of the positive-sign load and that of the negative-sign load while taking in to account the load direction (when calculating the average axial load of the positive-sign load, assume the negative-sign load to be zero). Of the two average axial loads, the greater value is regarded as the average axial load for calculating the service life.

Example: Calculate the average axial load with the following load conditions.

Operation No.	Varying load $F_{a_i}(N)$	Travel distance $l_n(mm)$
No.1	10	10
No.2	50	50
No.3	-40	10
No.4	-10	70

The subscripts of the fluctuating load symbol and the travel distance symbol indicate operation numbers.

#### ● Average axial load of positive-sign load

To calculate the average axial load of the positive-sign load, assume  $F_{a_3}$  and  $F_{a_4}$  to be zero.

$$F_{m1} = \sqrt[3]{\frac{F_{a1}^3 \times l_1 + F_{a2}^3 \times l_2}{l_1 + l_2 + l_3 + l_4}} = 35.5N$$

#### ● Average axial load of negative-sign load

To calculate the average axial load of the negative-sign load, assume  $F_{a_1}$  and  $F_{a_2}$  to be zero.

$$F_{m2} = \sqrt[3]{\frac{|F_{a3}|^3 \times l_3 + |F_{a4}|^3 \times l_4}{l_1 + l_2 + l_3 + l_4}} = 17.2N$$

Accordingly, the average axial load of the positive-sign load ( $F_{m1}$ ) is adopted as the average axial load ( $F_m$ ) for calculating the service life.

## Studying the Rigidity

To increase the positioning accuracy of feed screws in NC machine tools or the precision machines, or to reduce the displacement caused by the cutting force, it is necessary to design the rigidity of the components in a well-balanced manner.

### Axial Rigidity of the Feed Screw System

When the axial rigidity of a feed screw system is K, the elastic displacement in the axial direction can be obtained using the equation (31) below.

$$\delta = \frac{F_a}{K} \dots\dots\dots(31)$$

- δ : Elastic displacement of a feed screw system in the axial direction (μm)
- F<sub>a</sub> : Applied axial load (N)

The axial rigidity (K) of the feed screw system is obtained using the equation (32) below.

$$\frac{1}{K} = \frac{1}{K_s} + \frac{1}{K_N} + \frac{1}{K_B} + \frac{1}{K_H} \dots\dots\dots(32)$$

- K : Axial Rigidity of the Feed Screw System (N/μm)
- K<sub>s</sub> : Axial rigidity of the screw shaft (N/μm)
- K<sub>N</sub> : Axial rigidity of the nut (N/μm)
- K<sub>B</sub> : Axial rigidity of the support bearing(N/μm)
- K<sub>H</sub> : Rigidity of the nut bracket and the support bearing bracket (N/μm)

#### [Axial rigidity of the screw shaft]

The axial rigidity of a screw shaft varies depending on the method for mounting the shaft.

#### ● For Fixed-Supported (or -Free) Configuration

$$K_s = \frac{A \cdot E}{1000 \cdot L} \dots\dots\dots(33)$$

- A : Screw shaft cross-sectional area (mm<sup>2</sup>)

$$A = \frac{\pi}{4} d_1^2$$

- d<sub>1</sub> : Screw-shaft thread minor diameter (mm)
- E : Young's modulus (2.06 × 10<sup>5</sup> N/mm<sup>2</sup>)
- L : Distance between two mounting surfaces (mm)

Fig.10 onA-708 shows an axial rigidity diagram for the screw shaft.

● For Fixed-Fixed Configuration

$$K_s = \frac{A \cdot E \cdot L}{1000 \cdot a \cdot b} \dots\dots(34)$$

$K_s$  becomes the lowest and the elastic displacement in the axial direction is the greatest at the position of  $a = b = \frac{L}{2}$ .

$$K_s = \frac{4A \cdot E}{1000L}$$

Fig.11 on A-709 shows an axial rigidity diagram of the screw shaft in this configuration.

Fig.10 Axial Rigidity of the Screw Shaft (Fixed-Free, Fixed-Supported)

Fig.11 Axial Rigidity of the Screw Shaft (Fixed-Fixed)

**[Axial rigidity of the nut]**

The axial rigidity of the nut varies widely with preloads.

● **No Preload Type**

The logical rigidity in the axial direction when an axial load accounting for 30% of the basic dynamic load rating (Ca) is applied is indicated in the specification tables of the corresponding model number. This value does not include the rigidity of the components related to the nut-mounting bracket. In general, set the rigidity at roughly 80% of the value in the table.

The rigidity when the applied axial load is not 30% of the basic dynamic load rating (Ca) is calculated using the equation (35) below.

$$K_N = K \left( \frac{F_a}{0.3C_a} \right)^{\frac{1}{3}} \times 0.8 \dots\dots(35)$$

- $K_N$  : Axial rigidity of the nut (N/μm)
- $K$  : Rigidity value in the specification tables (N/μm)
- $F_a$  : Applied axial load (N)
- $C_a$  : Basic dynamic load rating (N)

### ● Preload Type

The logical rigidity in the axial direction when an axial load accounting for 10% of the basic dynamic load rating (Ca) is applied is indicated in the dimensional table of the corresponding model number. This value does not include the rigidity of the components related to the nut-mounting bracket. In general, generally set the rigidity at roughly 80% of the value in the table.

The rigidity when the applied preload is not 10% of the basic dynamic load rating (Ca) is calculated using the equation (36) below.

$$K_N = K \left( \frac{Fa_0}{0.1Ca} \right)^{\frac{1}{3}} \times 0.8 \dots\dots\dots(36)$$

$K_N$  : Axial rigidity of the nut (N/μm)

$K$  : Rigidity value in the specification tables (N/μm)

$Fa_0$  : Applied preload (N)

$Ca$  : Basic dynamic load rating (N)

#### [Axial rigidity of the support bearing]

The rigidity of the Ball Screw support bearing varies depending on the support bearing used.

The calculation of the rigidity with a representative angular ball bearing is shown in the equation (37) below.

$$K_B \doteq \frac{3Fa_0}{\delta a_0} \dots\dots\dots(37)$$

$K_B$  : Axial rigidity of the support bearing (N/μm)

$Fa_0$  : Applied preload of the support bearing (N)

$\delta a_0$  : Axial displacements (μm)

$$\delta a_0 = \frac{0.45}{\sin\alpha} \left( \frac{Q^2}{Da} \right)^{\frac{1}{3}}$$

$$Q = \frac{Fa_0}{Z \sin\alpha}$$

$Q$  : Axial load (N)

$Da$  : Ball diameter of the support bearing(mm)

$\alpha$  : Initial contact angle of the support bearing (°)

$Z$  : Number of balls

For details of a specific support bearing, contact its manufacturer.

#### [Axial Rigidity of the Nut Bracket and the Support Bearing Bracket]

Take this factor into consideration when designing your machine. Set the rigidity as high as possible.

# Studying the Positioning Accuracy

---

## Causes of Error in the Positioning Accuracy

---

The causes of error in the positioning accuracy include the lead angle accuracy, the axial clearance and the axial rigidity of the feed screw system. Other important factors include the thermal displacement from heat and the orientation change of the guide system during traveling.

---

## Studying the Lead Angle Accuracy

---

It is necessary to select the correct accuracy grade of the Ball Screw that satisfies the required positioning accuracy from the Ball Screw accuracies (Table1 on A-678). Table20 on A-712 shows examples of selecting the accuracy grades by the application.

---

## Studying the Axial Clearance

---

The axial clearance is not a factor of positioning accuracy in single-directional feed. However, it will cause a backlash when the feed direction is inversed or the axial load is inversed. Select an axial clearance that meets the required backlash from Table10 and Table12 on A-685.

Table 20 Examples of Selecting Accuracy Grades by Application

## Studying the Axial Clearance of the Feed Screw System

Of the axial rigidities of the feed screw system, the axial rigidity of the screw shaft fluctuates according to the stroke position. When the axial rigidity is large, such change in the axial rigidity of the screw shaft will affect the positioning accuracy. Therefore, it is necessary to take into account the rigidity of the feed screw system (A-707 to A-710).

Example: Positioning error due to the axial rigidity of the feed screw system during a vertical transfer

[Conditions]

Transferred weight: 1,000 N; table weight: 500 N

Ball Screw used: model BNF2512-2.5 (screw-shaft thread minor diameter  $d_1 = 21.9$  mm)

Stroke length: 600 mm ( $L=100$  mm to 700 mm)

Screw shaft mounting type: fixed-supported

[Consideration]

The difference in axial rigidity between  $L = 100$  mm and  $L = 700$  mm applied only to the axial rigidity of the screw shaft.

Therefore, positioning error due to the axial rigidity of the feed screw system equals to the difference in the axial displacement of the screw shaft between  $L = 100$  mm and  $L = 700$  mm.

**[Axial Rigidity of the Screw Shaft (see A-707 and A-708)]**

$$K_s = \frac{A \cdot E}{1000L} = \frac{376.5 \times 2.06 \times 10^5}{1000 \times L} = \frac{77.6 \times 10^3}{L}$$

$$A = \frac{\pi}{4} d_1^2 = \frac{\pi}{4} \times 21.9^2 = 376.5 \text{ mm}^2$$

$$E = 2.06 \times 10^5 \text{ N/mm}^2$$

(1) When L = 100 mm

$$K_{s1} = \frac{77.6 \times 10^3}{100} = 776 \text{ N/}\mu\text{m}$$

(2) When L = 700mm

$$K_{s2} = \frac{77.6 \times 10^3}{700} = 111 \text{ N/}\mu\text{m}$$

**[Axial Displacement due to Axial Rigidity of the Screw Shaft]**

(1) When L = 100 mm

$$\delta_1 = \frac{Fa}{K_{s1}} = \frac{1000+500}{776} = 1.9 \mu\text{m}$$

(2) When L = 700mm

$$\delta_2 = \frac{Fa}{K_{s2}} = \frac{1000+500}{111} = 13.5 \mu\text{m}$$

**[Positioning Error due to Axial Rigidity of the Feed Screw System]**

$$\text{Positioning accuracy} = \delta_1 - \delta_2 = 1.9 - 13.5 \\ = -11.6 \mu\text{m}$$

Therefore, the positioning error due to the axial rigidity of the feed screw system is 11.6  $\mu\text{m}$ .

## Studying the Thermal Displacement through Heat Generation

If the temperature of the screw shaft increases during operation, the screw shaft is elongated due to heat thereby to lowering the positioning accuracy. The expansion and contraction of the screw shaft is calculated using the equation (38) below.

$$\Delta l = \rho \times \Delta t \times l \dots\dots\dots(38)$$

$\Delta l$  : Axial expansion/contraction of  
the screw shaft (mm)

$\rho$  : Thermal expansion coefficient ( $12 \times 10^{-6}/^{\circ}\text{C}$ )

$\Delta t$  : Temperature change in  
the screw shaft ( $^{\circ}\text{C}$ )

$l$  : Effective thread length (mm)

Thus, if the temperature of the screw shaft increases by  $1^{\circ}\text{C}$ , the screw shaft is elongated by  $12 \mu\text{m}$  per meter. Therefore, as the Ball Screw travels faster, the more heat is generated. So, as the temperature increases, the positioning accuracy lowers. Accordingly, if high accuracy is required, it is necessary to take measures to cope with the temperature increase.

### [Measures to Cope with the Temperature Rise]

#### ● Minimize the Heat Generation

- Minimize the preloads on the Ball Screw and the support bearing.
- Increase the Ball Screw lead and reduce the rotational speed.
- Select a correct lubricant. (See Accessories for Lubrication on A-954.)
- Cool the circumference of the screw shaft with a lubricant or air.

#### ● Avoid Effect of Temperature Rise through Heat Generation

- Set a negative target value for the reference travel distance of the Ball Screw.  
Generally, set a negative target value for the reference travel distance assuming a temperature increase of  $2^{\circ}\text{C}$  to  $5^{\circ}\text{C}$  by heat.  
( $-0.02\text{mm}$  to  $-0.06 \text{ mm/m}$ )
- Preload the shaft screw with tension. (See Fig.3 of the structure on A-825.)

## Studying the Orientation Change during Traveling

The lead angle accuracy of the Ball Screw equals the positioning accuracy of the shaft center of the Ball Screw. Normally, the point where the highest positioning accuracy is required changes according to the ball screw center and the vertical or horizontal direction. Therefore, the orientation change during traveling affects the positioning accuracy.

The largest factor of orientation change affecting the positioning accuracy is pitching if the change occurs in the ball screw center and the vertical direction, and yawing if the change occurs in the horizontal direction.

Accordingly, it is necessary to study the orientation change (accuracy in pitching, yawing, etc.) during the traveling on the basis of the distance from the ball screw center to the location where positioning accuracy is required.

Positioning error due to pitching and yawing is obtained using the equation (39) below.

$$A = l \times \sin\theta \dots\dots\dots(39)$$

- A: Positioning accuracy due to pitching (or yawing) (mm)  
 $l$  : Vertical (or horizontal) distance from the ball screw center (mm) (see Fig.12)  
 $\theta$  : Pitching (or yawing) ( $^{\circ}$ )

Fig.12

## Studying the Rotational Torque

The rotational torque required to convert rotational motion of the Ball Screw into straight motion is obtained using the equation (40) below.

[During Uniform Motion]

$$\mathbf{T_t = T_1 + T_2 + T_4 \dots\dots\dots(40)}$$

$T_t$  : Rotational torque required during uniform motion (N-mm)

$T_1$  : Frictional torque due to an external load (N-mm)

$T_2$  : Preload torque of the Ball Screw (N-mm)

$T_4$  : Other torque (N-mm)  
(frictional torque of the support bearing and oil seal)

[During Acceleration]

$$\mathbf{T_k = T_t + T_3 \dots\dots\dots(41)}$$

$T_k$  : Rotational torque required during acceleration (N-mm)

$T_3$  : Torque required for acceleration (N-mm)

[During Deceleration]

$$\mathbf{T_g = T_t - T_3 \dots\dots\dots(42)}$$

$T_g$  : Rotational torque required for deceleration (N-mm)

### Frictional Torque Due to an External Load

Of the turning forces required for the Ball Screw, the rotational torque needed for an external load (guide surface resistance or external force) is obtained using the equation (43) below

$$\mathbf{T_1 = \frac{F_a \cdot Ph}{2\pi \cdot \eta} \cdot A \dots\dots\dots(43)}$$

$T_1$  : Frictional torque due to an external load (N-mm)

$F_a$  : Applied axial load (N)

$Ph$  : Ball Screw lead (mm)

$\eta$  : Ball Screw efficiency (0.9 to 0.95)

$A$  : Reduction ratio

---

## Torque Due to a Preload on the Ball Screw

---

For a preload on the Ball Screw, see "Preload Torque" on A-688.

$$\mathbf{T_2 = T_d \cdot A} \quad \dots\dots\dots(44)$$

$T_2$  : Preload torque of the Ball Screw (N-mm)

$T_d$  : Preload torque of the Ball Screw (N-mm)

$A$  : Reduction ratio

---

## Torque Required for Acceleration

---

$$\mathbf{T_3 = J \times \omega' \times 10^3} \quad \dots\dots\dots(45)$$

$T_3$  : Torque required for acceleration (N-mm)

$J$  : Inertial moment (kg·m<sup>2</sup>)

$\omega'$  : Angular acceleration (rad/s<sup>2</sup>)

$$J = m \left( \frac{Ph}{2\pi} \right)^2 \cdot A^2 \cdot 10^{-6} + J_s \cdot A^2 + J_A \cdot A^2 + J_B$$

$m$  : Transferred mass (kg)

$Ph$  : Ball Screw lead (mm)

$J_s$  : Inertial moment of the screw shaft (kg·m<sup>2</sup>)

(indicated in the specification tables of the respective model number)

$A$  : Reduction ratio

$J_A$  : Inertial moment of gears, etc. attached to the screw shaft side (kg·m<sup>2</sup>)

$J_B$  : Inertial moment of gears, etc. attached to the motor side (kg·m<sup>2</sup>)

$$\omega' = \frac{2\pi \cdot Nm}{60t}$$

$Nm$  : Motor revolutions per minute (min<sup>-1</sup>)

$t$  : Acceleration time (s)

[Ref.] Inertial moment of a round object

$$J = \frac{m \cdot D^2}{8 \cdot 10^6}$$

$J$  : Inertial moment (kg·m<sup>2</sup>)

$m$  : Mass of a round object (kg)

$D$  : Screw shaft outer diameter (mm)

## Studying the Driving Motor

When selecting a driving motor required to rotate the Ball Screw, normally take into account the rotational speed, rotational torque and minimum feed amount.

---

### When Using a Servomotor

---

#### [Rotational Speed]

The rotational speed required for the motor is obtained using the equation (46) based on the feed speed, Ball Screw lead and reduction ratio.

$$N_M = \frac{V \times 1000 \times 60}{Ph} \times \frac{1}{A} \dots\dots(46)$$

- $N_M$  : Required rotational speed  
of the motor (min<sup>-1</sup>)
- $V$  : Feeding speed (m/s)
- $Ph$  : Ball Screw lead (mm)
- $A$  : Reduction ratio

The rated rotational speed of the motor must be equal to or above the calculated value ( $N_M$ ) above.

$$N_M \leq N_R$$

- $N_R$  : The rated rotational speed  
of the motor (min<sup>-1</sup>)

#### [Required Resolution]

Resolutions required for the encoder and the driver are obtained using the equation (47) based on the minimum feed amount, Ball Screw lead and reduction ratio.

$$B = \frac{Ph \cdot A}{S} \dots\dots(47)$$

- $B$  : Resolution required for the encoder  
and the driver (p/rev)
- $Ph$  : Ball Screw lead (mm)
- $A$  : Reduction ratio
- $S$  : Minimum feed amount (mm)

**[Motor Torque]**

The torque required for the motor differs between uniform motion, acceleration and deceleration. To calculate the rotational torque, see "Studying the Rotational Torque" on A-717.

**a. Maximum torque**

The maximum torque required for the motor must be equal to or below the maximum peak torque of the motor.

$$T_{\max} \leq T_{p\max}$$

$T_{\max}$  : Maximum torque acting on the motor

$T_{p\max}$  : Maximum peak torque of the motor

**b. Effective torque value**

The effective value of the torque required for the motor must be calculated. The effective value of the torque is obtained using the equation (48) below.

$$T_{rms} = \sqrt{\frac{T_1^2 \times t_1 + T_2^2 \times t_2 + T_3^2 \times t_3}{t}} \dots\dots(48)$$

$T_{rms}$  : Effective torque value (N-mm)

$T_n$  : Fluctuating torque (N-mm)

$t_n$  : Time during which the torque

$T_n$  is applied (s)

$t$  : Cycle time (s)

( $t=t_1+t_2+t_3$ )

The calculated effective value of the torque must be equal to or below the rated torque of the motor.

$$T_{rms} \leq T_R$$

$T_R$  : Rated torque of the motor (N-mm)

**[Inertial Moment]**

The inertial moment required for the motor is obtained using the equation (49) below.

$$J_M = \frac{J}{C} \dots\dots(49)$$

$J_M$  : Inertial moment required for the motor ( $\text{kg} \cdot \text{m}^2$ )

$C$  : Factor determined by the motor and the driver

(It is normally between 3 to 10. However, it varies depending on the motor and the driver. Check the specific value in the catalog by the motor manufacturer.)

The inertial moment of the motor must be equal to or above the calculated  $J_M$  value.

## When Using a Stepping Motor (Pulse Motor)

### [Minimal Feed Amount(per Step)]

The step angle required for the motor and the driver is obtained using the equation (50) below based on the minimum feed amount, the Ball Screw lead and the reduction ratio.

$$E = \frac{360S}{Ph \cdot A} \dots\dots(50)$$

- E : Step angle required for the motor and the driver (°)  
 S : Minimum feed amount (mm)  
     (per step)  
 Ph : Ball Screw lead (mm)  
 A : Reduction ratio

### [Pulse Speed and Motor Torque]

a. Pulse speed

The pulse speed is obtained using the equation (51) below based on the feed speed and the minimum feed amount.

$$f = \frac{V \times 1000}{S} \dots\dots(51)$$

- f : Pulse speed (Hz)  
 V : Feeding speed (m/s)  
 S : Minimum feed amount (mm)

b. Torque required for the motor

The torque required for the motor differs between the uniform motion, the acceleration and the deceleration. To calculate the rotational torque, see "Studying the Rotational Torque" on A-717.

Thus, the pulse speed required for the motor and the required torque can be calculated in the manner described above.

Although the torque varies depending on the motors, normally the calculated torque should be doubled to ensure safety. Check if the torque can be used in the motor's speed-torque curve.

## Examples of Selecting a Ball Screw

### High-speed Transfer Equipment (Horizontal Use)

#### [Selection Conditions]

Table Mass	$m_1 = 60\text{kg}$	Positioning Repeatability	$\pm 0.1\text{ mm}$
Work Mass	$m_2 = 20\text{kg}$	Minimum feed amount	$s = 0.02\text{mm/pulse}$
Stroke length	$l_s = 1000\text{mm}$	Desired service life time	30000h
Maximum speed	$V_{\text{max}} = 1\text{m/s}$	Driving motor	AC servo motor
Acceleration time	$t_1 = 0.15\text{s}$	Rated rotational speed:	$3,000\text{ min}^{-1}$
Deceleration time	$t_3 = 0.15\text{s}$	Inertial moment of the motor	$J_m = 1 \times 10^{-3}\text{ kg} \cdot \text{m}^2$
Number of reciprocations per minute	$n = 8\text{min}^{-1}$	Reduction gear	None (direct coupling)
Backlash	0.15mm		$A=1$
Positioning accuracy	$\pm 0.3\text{ mm}/1000\text{ mm}$ (Perform positioning from the negative direction)	Frictional coefficient of the guide surface	$\mu = 0.003$ (rolling)
		Guide surface resistance	$f = 15\text{ N}$ (without load)

#### [Selection Items]

Screw shaft diameter

Lead

Nut model No.

Accuracy

Axial clearance

Screw shaft support method

Driving motor

**[Selecting Lead Angle Accuracy and Axial Clearance]****● Selecting Lead Angle Accuracy**

To achieve positioning accuracy of  $\pm 0.3$  mm/1,000 mm:

$$\frac{\pm 0.3}{1000} = \frac{\pm 0.09}{300}$$

The lead angle accuracy must be  $\pm 0.09$  mm/300 mm or higher.

Therefore, select the following as the accuracy grade of the Ball Screw (see Table1 on A-678).

C7 (travel distance error:  $\pm 0.05$ mm/300mm)

Accuracy grade C7 is available for both the Rolled and the Precision Ball Screws. Assume that a Rolled Ball Screw is selected here because it is less costly.

**● Selecting Axial Clearance**

To satisfy the backlash of 0.15 mm, it is necessary to select a Ball Screw with an axial clearance of 0.15 mm or less.

Therefore, a Rolled Ball Screw model with a screw shaft diameter of 32 mm or less that meets the axial clearance of 0.15 mm or less (see Table12 on A-685) meets the requirements.

Thus, a Rolled Ball Screw model with a screw shaft diameter of 32 mm or less and an accuracy grade of C7 is selected.

**[Selecting a Screw Shaft]****● Assuming the Screw Shaft Length**

Assume the overall nut length to be 100 mm and the screw shaft end length to be 100 mm.

Therefore, the overall length is determined as follows based on the stroke length of 1,000 mm.

$$1000 + 200 = 1200 \text{ mm}$$

Thus, the screw shaft length is assumed to be 1,200 mm.

**● Selecting a Lead**

With the driving motor's rated rotational speed being  $3,000 \text{ min}^{-1}$  and the maximum speed 1 m/s, the Ball Screw lead is obtained as follows:

$$\frac{1 \times 1000 \times 60}{3000} = 20 \text{ mm}$$

Therefore, it is necessary to select a type with a lead of 20 mm or longer.

In addition, the Ball Screw and the motor can be mounted in direct coupling without using a reduction gear. The minimum resolution per revolution of an AC servomotor is obtained based on the resolution of the encoder (1,000 p/rev; 1,500 p/rev) provided as a standard accessory for the AC servomotor, as indicated below.

1000 p/rev(without multiplication)

1500 p/rev(without multiplication)

2000 p/rev(doubled)

3000 p/rev(doubled)

4000 p/rev(quadupled)

6000 p/rev(quadupled)

To meet the minimum feed amount of 0.02 mm/pulse, which is the selection requirement, the following should apply.

Lead	20mm	—	1000 p/rev
	30mm	—	1500 p/rev
	40mm	—	2000 p/rev
	60mm	—	3000 p/rev
	80mm	—	4000 p/rev

#### ● **Selecting a Screw Shaft Diameter**

Those Ball Screw models that meet the requirements defined in Section [Selecting Lead Angle Accuracy and Axial Clearance] on A-723: a rolled Ball Screw with a screw shaft diameter of 32 mm or less; and the requirement defined in Section [Selecting a Screw Shaft] on A-723: a lead of 20, 30, 40, 60 or 80 mm (see Table17 on A-693) are as follows.

Shaft diameter	Lead
15mm	— 20mm
15mm	— 30mm
20mm	— 20mm
20mm	— 40mm
30mm	— 60mm

Since the screw shaft length has to be 1,200 mm as indicated in Section [Selecting a Screw Shaft] on A-723, the shaft diameter of 15 mm is insufficient. Therefore, the Ball Screw should have a screw shaft diameter of 20 mm or greater.

Accordingly, there are three combinations of screw shaft diameters and leads that meet the requirements: screw shaft diameter of 20 mm/lead of 20 mm; 20 mm/40 mm; and 30 mm/60 mm.

#### ● **Selecting a Screw Shaft Support Method**

Since the assumed type has a long stroke length of 1,000 mm and operates at high speed of 1 m/s, select either the fixed-supported or fixed-fixed configuration for the screw shaft support.

However, the fixed-fixed configuration requires a complicated structure, needs high accuracy in the installation.

Accordingly, the fixed-supported configuration is selected as the screw shaft support method.

## ● Studying the Permissible Axial Load

### ■ Calculating the Maximum Axial Load

Guide surface resistance	$f=15$ N (without load)
Table Mass	$m_1 =60$ kg
Work Mass	$m_2 =20$ kg
Frictional coefficient of the guide surface	$\mu = 0.003$
Maximum speed	$V_{\max}=1$ m/s
Gravitational acceleration	$g = 9.807$ m/s <sup>2</sup>
Acceleration time	$t_1 = 0.15$ s

Accordingly, the required values are obtained as follows.

Acceleration:

$$\alpha = \frac{V_{\max}}{t_1} = 6.67 \text{ m/s}^2$$

During forward acceleration:

$$Fa_1 = \mu \cdot (m_1 + m_2) g + f + (m_1 + m_2) \cdot \alpha = 550 \text{ N}$$

During forward uniform motion:

$$Fa_2 = \mu \cdot (m_1 + m_2) g + f = 17 \text{ N}$$

During forward deceleration:

$$Fa_3 = \mu \cdot (m_1 + m_2) g + f - (m_1 + m_2) \cdot \alpha = -516 \text{ N}$$

During backward acceleration:

$$Fa_4 = -\mu \cdot (m_1 + m_2) g - f - (m_1 + m_2) \cdot \alpha = -550 \text{ N}$$

During uniform backward motion:

$$Fa_5 = -\mu \cdot (m_1 + m_2) g - f = -17 \text{ N}$$

During backward deceleration:

$$Fa_6 = -\mu \cdot (m_1 + m_2) g - f + (m_1 + m_2) \cdot \alpha = 516 \text{ N}$$

Thus, the maximum axial load applied on the Ball Screw is as follows:

$$Fa_{\max} = Fa_1 = 550 \text{ N}$$

Therefore, if there is no problem with a shaft diameter of 20 mm and a lead of 20 mm (smallest thread minor diameter of 17.5 mm), then the screw shaft diameter of 30 mm should meet the requirements. Thus, the following calculations for the buckling load and the permissible compressive and tensile load of the screw shaft are performed while assuming a screw shaft diameter of 20 mm and a lead of 20 mm.

### ■ Buckling Load on the Screw Shaft

Factor according to the mounting method  $\eta_z=20$  (see A-694)

Since the mounting method for the section between the nut and the bearing, where buckling is to be considered, is "fixed-fixed":

Distance between two mounting surfaces  $l_a=1100$  mm (estimate)

Screw-shaft thread minor diameter  $d_1=17.5$  mm

$$P_1 = \eta_z \cdot \frac{d_1^4}{l_a^2} \times 10^4 = 20 \times \frac{17.5^4}{1100^2} \times 10^4 = 15500 \text{ N}$$

### ■ Permissible Compressive and Tensile Load of the Screw Shaft

$$P_2 = 116 \times d_1^2 = 116 \times 17.5^2 = 35500 \text{ N}$$

Thus, the buckling load and the permissible compressive and the tensile load of the screw shaft are at least equal to the maximum axial load. Therefore, a Ball Screw that meets these requirements can be used without a problem.

### ● Studying the Permissible Rotational Speed

#### ■ Maximum Rotational Speed

- Screw shaft diameter: 20 mm; lead: 20 mm

Maximum speed  $V_{\max}=1$  m/s

Lead  $Ph=20$  mm

$$N_{\max} = \frac{V_{\max} \times 60 \times 10^3}{Ph} = 3000 \text{ min}^{-1}$$

- Screw shaft diameter: 20 mm; lead: 40mm

Maximum speed  $V_{\max}=1$  m/s

Lead  $Ph=40$  mm

$$N_{\max} = \frac{V_{\max} \times 60 \times 10^3}{Ph} = 1500 \text{ min}^{-1}$$

- Screw shaft diameter: 30mm; lead: 60mm

Maximum speed  $V_{\max}=1$  m/s

Lead  $Ph=60$  mm

$$N_{\max} = \frac{V_{\max} \times 60 \times 10^3}{Ph} = 1000 \text{ min}^{-1}$$

### ■ Permissible Rotational Speed Determined by the Dangerous Speed of the Screw Shaft

Factor according to the mounting method  $\lambda_2=15.1$  (see A-696)

Since the mounting method for the section between the nut and the bearing, where dangerous speed is to be considered, is "fixed-supported: "

Distance between two mounting surfaces  $\ell_b=1100$  mm (estimate)

- Screw shaft diameter: 20 mm; lead: 20 mm and 40 mm

Screw-shaft thread minor diameter  $d_1=17.5$  mm

$$N_1 = \lambda_2 \times \frac{d_1}{\ell_b^2} 10^7 = 15.1 \times \frac{17.5}{1100^2} \times 10^7 = 2180 \text{ min}^{-1}$$

- Screw shaft diameter: 30 mm; lead: 60 mm

Screw-shaft thread minor diameter  $d_1=26.4$  mm

$$N_1 = \lambda_2 \times \frac{d_1}{\ell_b^2} 10^7 = 15.1 \times \frac{26.4}{1100^2} \times 10^7 = 3294 \text{ min}^{-1}$$

### ■ Permissible Rotational Speed Determined by the DN Value

- Screw shaft diameter: 20 mm and 40 mm (large lead Ball Screw)

Ball center-to-center diameter  $D=20.75$  mm

$$N_2 = \frac{70000}{D} = \frac{70000}{20.75} = 3370 \text{ min}^{-1}$$

- Screw shaft diameter: 30 mm; lead: 60 mm (large lead Ball Screw)

Ball center-to-center diameter  $D=31.25$  mm

$$N_2 = \frac{70000}{D} = \frac{70000}{31.25} = 2240 \text{ min}^{-1}$$

Thus, with a Ball Screw having a screw shaft diameter of 20 mm and a lead of 20 mm, the maximum rotational speed exceeds the dangerous speed.

In contrast, a combination of a screw shaft diameter of 20 mm and a lead of 40 mm, and another of a screw shaft diameter of 30 mm and a lead of 60 mm, meet the dangerous speed and the DN value.

Accordingly, a Ball Screw with a screw shaft diameter of 20 mm and a lead of 40 mm, or with a screw shaft diameter of 30 mm and a lead of 60 mm, is selected.

### [Selecting a Nut]

#### ● Selecting a Nut Model Number

Rolled Ball Screw models with a screw shaft diameter of 20 mm and a lead of 40 mm, or with a screw shaft diameter of 30 mm and a lead of 60 mm, are large lead Rolled Ball Screw model WTF variations.

WTF2040-2

( $C_a=5.4$  kN,  $C_{0a}=13.6$  kN)

WTF2040-3

( $C_a=6.6$  kN,  $C_{0a}=17.2$  kN)

WTF3060-2

( $C_a=11.8$  kN,  $C_{0a}=30.6$  kN)

WTF3060-3

( $C_a=14.5$  kN,  $C_{0a}=38.9$  kN)

### ● Studying the Permissible Axial Load

Study the permissible axial load of model WTF2040-2 ( $C_{0a} = 13.6$  kN).

Assuming that this model is used in high-speed transfer equipment and an impact load is applied during deceleration, set the static safety factor ( $f_s$ ) at 2.5 (see Table18 on A-703).

$$\frac{C_{0a}}{f_s} = \frac{13.6}{2.5} = 5.44 \text{ kN} = 5440 \text{ N}$$

The obtained permissible axial load is greater than the maximum axial load of 550 N, and therefore, there will be no problem with this model.

### ■ Calculating the Travel Distance

Maximum speed  $V_{\max}=1$  m/s

Acceleration time  $t_1 = 0.15$ s

Deceleration time  $t_3 = 0.15$ s

#### ● Travel distance during acceleration

$$l_{1,4} = \frac{V_{\max} \cdot t_1}{2} \times 10^3 = \frac{1 \times 0.15}{2} \times 10^3 = 75 \text{ mm}$$

#### ● Travel distance during uniform motion

$$l_{2,5} = l_s - \frac{V_{\max} \cdot t_1 + V_{\max} \cdot t_3}{2} \times 10^3 = 1000 - \frac{1 \times 0.15 + 1 \times 0.15}{2} \times 10^3 = 850 \text{ mm}$$

#### ● Travel distance during deceleration

$$l_{3,6} = \frac{V_{\max} \cdot t_3}{2} \times 10^3 = \frac{1 \times 0.15}{2} \times 10^3 = 75 \text{ mm}$$

Based on the conditions above, the relationship between the applied axial load and the travel distance is shown in the table below.

Motion	Applied axial load $F_{a_N}$ (N)	Travel distance $l_N$ (mm)
No.1: During forward acceleration	550	75
No.2: During forward uniform motion	17	850
No.3: During forward deceleration	-516	75
No.4: During backward acceleration	-550	75
No.5: During uniform backward motion	-17	850
No.6: During backward deceleration	516	75

\* The subscript (N) indicates a motion number.

Since the load direction (as expressed in positive or negative sign) is reversed with  $F_{a_3}$ ,  $F_{a_4}$  and  $F_{a_5}$ , calculate the average axial load in the two directions.

### ■ Average Axial Load

- Average axial load in the positive direction

Since the load direction varies, calculate the average axial load while assuming  $F_{a_{3,4,5}} = 0N$ .

$$F_{m1} = \sqrt[3]{\frac{F_{a1}^3 \times l_1 + F_{a2}^3 \times l_2 + F_{a6}^3 \times l_6}{l_1 + l_2 + l_3 + l_4 + l_5 + l_6}} = 225 \text{ N}$$

- Average axial load in the negative direction

Since the load direction varies, calculate the average axial load while assuming  $F_{a_{1,2,6}} = 0N$ .

$$F_{m2} = \sqrt[3]{\frac{|F_{a3}|^3 \times l_3 + |F_{a4}|^3 \times l_4 + |F_{a5}|^3 \times l_5}{l_1 + l_2 + l_3 + l_4 + l_5 + l_6}} = 225 \text{ N}$$

Since  $F_{m1} = F_{m2}$ , assume the average axial load to be  $F_m = F_{m1} = F_{m2} = 225 \text{ N}$ .

### ■ Nominal Life

Load factor  $f_w = 1.5$  (see Table 19 on A-704)

Average load  $F_m = 225 \text{ N}$

Nominal life  $L$  (rev)

$$L = \left( \frac{C_a}{f_w \cdot F_m} \right)^3 \times 10^6$$

Assumed model number	Dynamic load rating $C_a(N)$	Nominal life $L(\text{rev})$
WTF 2040-2	5400	$4.1 \times 10^9$
WTF 2040-3	6600	$7.47 \times 10^9$
WTF 3060-2	11800	$4.27 \times 10^{10}$
WTF 3060-3	14500	$7.93 \times 10^{10}$

### ■ Average Revolutions per Minute

Number of reciprocations per minute  $n = 8 \text{ min}^{-1}$

Stroke  $\ell_s = 1000 \text{ mm}$

- Lead:  $Ph = 40 \text{ mm}$

$$N_m = \frac{2 \times n \times \ell_s}{Ph} = \frac{2 \times 8 \times 1000}{40} = 400 \text{ min}^{-1}$$

- Lead:  $Ph = 60 \text{ mm}$

$$N_m = \frac{2 \times n \times \ell_s}{Ph} = \frac{2 \times 8 \times 1000}{60} = 267 \text{ min}^{-1}$$

### ■ Calculating the Service Life Time on the Basis of the Nominal Life

- WTF2040-2

Nominal life  $L = 4.1 \times 10^9 \text{ rev}$

Average revolutions per minute  $N_m = 400 \text{ min}^{-1}$

$$L_h = \frac{L}{60 \times N_m} = \frac{4.1 \times 10^9}{60 \times 400} = 171000 \text{ h}$$

- WTF2040-3

Nominal life  $L = 7.47 \times 10^9 \text{ rev}$

Average revolutions per minute  $N_m = 400 \text{ min}^{-1}$

$$L_h = \frac{L}{60 \times N_m} = \frac{7.47 \times 10^9}{60 \times 400} = 311000 \text{ h}$$

- WTF3060-2

Nominal life  $L = 4.27 \times 10^{10} \text{ rev}$

Average revolutions per minute  $N_m = 267 \text{ min}^{-1}$

$$L_h = \frac{L}{60 \times N_m} = \frac{4.27 \times 10^{10}}{60 \times 267} = 2670000 \text{ h}$$

- WTF3060-3

Nominal life  $L = 7.93 \times 10^{10} \text{ rev}$

Average revolutions per minute  $N_m = 267 \text{ min}^{-1}$

$$L_h = \frac{L}{60 \times N_m} = \frac{7.93 \times 10^{10}}{60 \times 267} = 4950000 \text{ h}$$

**Point of Selection****Examples of Selecting a Ball Screw****■ Calculating the Service Life in Travel Distance on the Basis of the Nominal Life**

## ● WTF2040-2

Nominal life

L=4.1 × 10<sup>9</sup> rev

Lead

Ph= 40 mm

$$L_s = L \times Ph \times 10^{-6} = 164000 \text{ km}$$

## ● WTF2040-3

Nominal life

L=7.47 × 10<sup>9</sup> rev

Lead

Ph= 40 mm

$$L_s = L \times Ph \times 10^{-6} = 298800 \text{ km}$$

## ● WTF3060-2

Nominal life

L=4.27 × 10<sup>10</sup> rev

Lead

Ph= 60 mm

$$L_s = L \times Ph \times 10^{-6} = 2562000 \text{ km}$$

## ● WTF3060-3

Nominal life

L=7.93 × 10<sup>10</sup> rev

Lead

Ph= 60 mm

$$L_s = L \times Ph \times 10^{-6} = 4758000 \text{ km}$$

With all the conditions stated above, the following models satisfying the desired service life time of 30,000 hours are selected.

WTF 2040-2

WTF 2040-3

WTF 3060-2

WTF 3060-3

**[Studying the Rigidity]**

Since the conditions for selection do not include rigidity and this element is not particularly necessary, it is not described here.

**[Studying the Positioning Accuracy]****● Studying the Lead Angle Accuracy**

Accuracy grade C7 was selected in Section [Selecting Lead Angle Accuracy and Axial Clearance] on A-723.

C7 (travel distance error:  $\pm 0.05\text{mm}/300\text{mm}$ )

**● Studying the Axial Clearance**

Since positioning is performed in a given direction only, axial clearance is not included in the positioning accuracy. As a result, there is no need to study the axial clearance.

WTF2040: axial clearance: 0.1 mm

WTF3060: axial clearance: 0.14 mm

**● Studying the Axial Rigidity**

Since the load direction does not change, it is unnecessary to study the positioning accuracy on the basis of the axial rigidity.

**● Studying the Thermal Displacement through Heat Generation**

Assume the temperature rise during operation to be  $5^{\circ}\text{C}$ .

The positioning accuracy based on the temperature rise is obtained as follows:

$$\begin{aligned}\Delta l &= \rho \times \Delta t \times l \\ &= 12 \times 10^{-6} \times 5 \times 1000 \\ &= 0.06 \text{ mm}\end{aligned}$$

**● Studying the Orientation Change during Traveling**

Since the ball screw center is 150 mm away from the point where the highest accuracy is required, it is necessary to study the orientation change during traveling.

Assume that pitching can be done within  $\pm 10$  seconds because of the structure. The positioning error due to the pitching is obtained as follows:

$$\begin{aligned}\Delta a &= l \times \sin\theta \\ &= 150 \times \sin(\pm 10'') \\ &= \pm 0.007 \text{ mm}\end{aligned}$$

Thus, the positioning accuracy ( $\Delta p$ ) is obtained as follows:

$$\Delta p = \frac{\pm 0.05 \times 1000}{300} \pm 0.007 + 0.06 = 0.234 \text{ mm}$$

Since models WTF2040-2, WTF2040-3, WTF3060-2 and WTF3060-3 meet the selection requirements throughout the studying process in Section [Selecting Lead Angle Accuracy and Axial Clearance] on A-723 to Section [Studying the Positioning Accuracy] on A-732, the most compact model WTF2040-2 is selected.

**[Studying the Rotational Torque]****● Friction Torque Due to an External Load**

The friction torque is obtained as follows:

$$T_1 = \frac{F_a \cdot Ph}{2\pi \cdot \eta} \cdot A = \frac{17 \times 40}{2 \times \pi \times 0.9} \times 1 = 120 \text{ N} \cdot \text{mm}$$

**● Torque Due to a Preload on the Ball Screw**

The Ball Screw is not provided with a preload.

**● Torque Required for Acceleration**

Inertial Moment

Since the inertial moment per unit length of the screw shaft is  $1.23 \times 10^{-3} \text{ kg} \cdot \text{cm}^2/\text{mm}$  (see the specification table), the inertial moment of the screw shaft with an overall length of 1200 mm is obtained as follows.

$$J_s = 1.23 \times 10^{-3} \times 1200 = 1.48 \text{ kg} \cdot \text{cm}^2 \\ = 1.48 \times 10^{-4} \text{ kg} \cdot \text{m}^2$$

$$J = (m_1 + m_2) \left( \frac{Ph}{2 \times \pi} \right)^2 \cdot A^2 \times 10^{-6} + J_s \cdot A^2 = (60 + 20) \left( \frac{40}{2 \times \pi} \right)^2 \times 1^2 \times 10^{-6} + 1.48 \times 10^{-4} \times 1^2 \\ = 3.39 \times 10^{-3} \text{ kg} \cdot \text{m}^2$$

Angular acceleration:

$$\omega' = \frac{2\pi \cdot Nm}{60 \cdot t_1} = \frac{2\pi \times 1500}{60 \times 0.15} = 1050 \text{ rad/s}^2$$

Based on the above, the torque required for acceleration is obtained as follows.

$$T_2 = (J + J_m) \times \omega' = (3.39 \times 10^{-3} + 1 \times 10^{-3}) \times 1050 = 4.61 \text{ N} \cdot \text{m} \\ = 4.61 \times 10^3 \text{ N} \cdot \text{mm}$$

Therefore, the required torque is specified as follows.

During acceleration

$$T_k = T_1 + T_2 = 120 + 4.61 \times 10^3 = 4730 \text{ N} \cdot \text{mm}$$

During uniform motion

$$T_i = T_1 = 120 \text{ N} \cdot \text{mm}$$

During deceleration

$$T_g = T_1 - T_2 = 120 - 4.61 \times 10^3 = -4490 \text{ N} \cdot \text{mm}$$

### [Studying the Driving Motor]

#### ● Rotational Speed

Since the Ball Screw lead is selected based on the rated rotational speed of the motor, it is unnecessary to study the rotational speed of the motor.

Maximum working rotational speed: 1500 min<sup>-1</sup>

Rated rotational speed of the motor: 3000 min<sup>-1</sup>

#### ● Minimum Feed Amount

As with the rotational speed, the Ball Screw lead is selected based on the encoder normally used for an AC servomotor. Therefore, it is unnecessary to study this factor.

Encoder resolution : 1000 p/rev.

Doubled : 2000 p/rev

#### ● Motor Torque

The torque during acceleration calculated in Section [Studying the Rotational Torque] on A-733 is the required maximum torque.

$$T_{max} = 4730 \text{ N} \cdot \text{mm}$$

Therefore, the instantaneous maximum torque of the AC servomotor needs to be at least 4,730 N·mm.

#### ● Effective Torque Value

The selection requirements and the torque calculated in Section [Studying the Rotational Torque] on A-733 can be expressed as follows.

During acceleration:

$$T_k = 4730 \text{ N} \cdot \text{mm}$$

$$t_1 = 0.15 \text{ s}$$

During uniform motion:

$$T_l = 120 \text{ N} \cdot \text{mm}$$

$$t_2 = 0.85 \text{ s}$$

During deceleration:

$$T_g = 4490 \text{ N} \cdot \text{mm}$$

$$t_3 = 0.15 \text{ s}$$

When stationary:

$$T_s = 0$$

$$t_4 = 2.6 \text{ s}$$

The effective torque is obtained as follows, and the rated torque of the motor must be 1305 N·mm or greater.

$$T_{rms} = \sqrt{\frac{T_k^2 \cdot t_1 + T_l^2 \cdot t_2 + T_g^2 \cdot t_3 + T_s^2 \cdot t_4}{t_1 + t_2 + t_3 + t_4}} = \sqrt{\frac{4730^2 \times 0.15 + 120^2 \times 0.85 + 4490^2 \times 0.15 + 0}{0.15 + 0.85 + 0.15 + 2.6}}$$

$$= 1305 \text{ N} \cdot \text{mm}$$

**● Inertial Moment**

The inertial moment applied to the motor equals to the inertial moment calculated in Section [Studying the Rotational Torque] on A-733.

$$J = 3.39 \times 10^{-3} \text{ kg} \cdot \text{m}^2$$

Normally, the motor needs to have an inertial moment at least one tenth of the inertial moment applied to the motor, although the specific value varies depending on the motor manufacturer.

Therefore, the inertial moment of the AC servomotor must be  $3.39 \times 10^{-4} \text{ kg} \cdot \text{m}^2$  or greater.

The selection has been completed.

## Vertical Conveyance System

### [Selection Conditions]

Table Mass	$m_1 = 40\text{kg}$
Work Mass	$m_2 = 10\text{kg}$
Stroke length	$l_s = 600\text{mm}$
Maximum speed	$V_{\max} = 0.3\text{m/s}$
Acceleration time	$t_1 = 0.2\text{s}$
Deceleration time	$t_3 = 0.2\text{s}$
Number of reciprocations per minute	$n = 5\text{min}^{-1}$
Backlash	0.1mm
Positioning accuracy	$\pm 0.7\text{mm}/600\text{mm}$
Positioning Repeatability	$\pm 0.05\text{mm}$
Minimum feed amount	$s = 0.01\text{mm/pulse}$
Service life time	20000h
Driving motor	AC servo motor
	Rated rotational speed:
	$3,000\text{ min}^{-1}$
Inertial moment of the motor	$J_m = 5 \times 10^{-5}\text{ kg} \cdot \text{m}^2$
Reduction gear	None (direct coupling)
Frictional coefficient of the guide surface	$\mu = 0.003$ (rolling)
Guide surface resistance	$f = 20\text{ N}$ (without load)

### [Selection Items]

Screw shaft diameter  
 Lead  
 Nut model No.  
 Accuracy  
 Axial clearance  
 Screw shaft support method  
 Driving motor

**[Selecting Lead Angle Accuracy and Axial Clearance]****● Selecting the Lead Angle Accuracy**

To achieve positioning accuracy of  $\pm 0.7\text{mm}/600\text{mm}$ :

$$\frac{\pm 0.7}{600} = \frac{\pm 0.35}{300}$$

The lead angle accuracy must be  $\pm 0.35\text{mm}/300\text{ mm}$  or higher.

Therefore, the accuracy grade of the Ball Screw (see Table1 on A-678) needs to be C10 (travel distance error:  $\pm 0.21\text{ mm}/300\text{ mm}$ ).

Accuracy grade C10 is available for low priced, Rolled Ball Screws. Assume that a Rolled Ball Screw is selected.

**● Selecting the Axial Clearance**

The required backlashes is 0.1 mm or less. However, since an axial load is constantly applied in a single direction with vertical mount, the axial load does not serve as a backlash no matter how large it is.

Therefore, a low price, rolled Ball Screw is selected since there will not be a problem in axial clearance.

**[Selecting a Screw Shaft]****● Assuming the Screw Shaft Length**

Assume the overall nut length to be 100 mm and the screw shaft end length to be 100 mm.

Therefore, the overall length is determined as follows based on the stroke length of 600mm.

$$600 + 200 = 800\text{ mm}$$

Thus, the screw shaft length is assumed to be 800 mm.

**● Selecting the Lead**

With the driving motor's rated rotational speed being  $3,000\text{ min}^{-1}$  and the maximum speed 0.3 m/s, the Ball Screw lead is obtained as follows:

$$\frac{0.3 \times 60 \times 1000}{3000} = 6\text{ mm}$$

Therefore, it is necessary to select a type with a lead of 6mm or longer.

In addition, the Ball Screw and the motor can be mounted in direct coupling without using a reduction gear. The minimum resolution per revolution of an AC servomotor is obtained based on the resolution of the encoder (1,000 p/rev; 1,500 p/rev) provided as a standard accessory for the AC servomotor, as indicated below.

1000 p/rev(without multiplication)

1500 p/rev(without multiplication)

2000 p/rev(doubled)

3000 p/rev(doubled)

4000 p/rev(quadupled)

6000 p/rev(quadupled)

To meet the minimum feed amount of 0.010mm/pulse, which is the selection requirement, the following should apply.

Lead	6mm	—	3000 p/rev
	8mm	—	4000 p/rev
	10mm	—	1000 p/rev
	20mm	—	2000 p/rev
	40mm	—	2000 p/rev

However, with the lead being 6 mm or 8 mm, the feed distance is 0.002 mm/pulse, and the starting pulse of the controller that issues commands to the motor driver needs to be at least 150 kpps, and the cost of the controller may be higher.

In addition, if the lead of the Ball Screw is greater, the torque required for the motor is also greater, and thus the cost will be higher.

Therefore, select 10 mm for the Ball Screw lead.

### ● **Selecting the Screw Shaft Diameter**

Those Ball Screw models that meet the lead being 10 mm as described in Section [Selecting Lead Angle Accuracy and Axial Clearance] on A-737 and Section [Selecting a Screw Shaft] on A-737 (see Table17 on A-693) are as follows.

Shaft diameter	Lead
15mm	— 10mm
20mm	— 10mm
25mm	— 10mm

Accordingly, the combination of a screw shaft diameter of 15 mm and a lead 10 mm is selected.

### ● **Selecting the Screw Shaft Support Method**

Since the assumed Ball Screw has a stroke length of 600 mm and operates at a maximum speed of 0.3 m/s (Ball Screw rotational speed: 1,800 min<sup>-1</sup>), select the fixed-supported configuration for the screw shaft support.

## ● Studying the Permissible Axial Load

### ■ Calculating the Maximum Axial Load

Guide surface resistance	$f=20$ N (without load)
Table Mass	$m_1=40$ kg
Work Mass	$m_2=10$ kg
Maximum speed	$V_{\max}=0.3$ m/s
Acceleration time	$t_1=0.2$ s

Accordingly, the required values are obtained as follows.

Acceleration

$$\alpha = \frac{V_{\max}}{t_1} = 1.5 \text{ m/s}^2$$

During upward acceleration:

$$Fa_1 = (m_1 + m_2) \cdot g + f + (m_1 + m_2) \cdot \alpha = 585 \text{ N}$$

During upward uniform motion:

$$Fa_2 = (m_1 + m_2) \cdot g + f = 510 \text{ N}$$

During upward deceleration:

$$Fa_3 = (m_1 + m_2) \cdot g + f - (m_1 + m_2) \cdot \alpha = 435 \text{ N}$$

During downward acceleration:

$$Fa_4 = (m_1 + m_2) \cdot g - f - (m_1 + m_2) \cdot \alpha = 395 \text{ N}$$

During downward uniform motion:

$$Fa_5 = (m_1 + m_2) \cdot g - f = 470 \text{ N}$$

During downward deceleration:

$$Fa_6 = (m_1 + m_2) \cdot g - f + (m_1 + m_2) \cdot \alpha = 545 \text{ N}$$

Thus, the maximum axial load applied on the Ball Screw is as follows:

$$Fa_{\max} = Fa_1 = 585 \text{ N}$$

### ■ Buckling Load of the Screw Shaft

Factor according to the mounting method  $\eta_2=20$  (see A-694)

Since the mounting method for the section between the nut and the bearing, where buckling is to be considered, is "fixed-fixed:"

Distance between two mounting surfaces  $l_a=700$  mm (estimate)

Screw-shaft thread minor diameter  $d=12.5$  mm

$$P_1 = \eta_2 \cdot \frac{d^4}{l_a^2} \times 10^4 = 20 \times \frac{12.5^4}{700^2} \times 10^4 = 9960 \text{ N}$$

### ■ Permissible Compressive and Tensile Load of the Screw Shaft

$$P_2 = 116d^2 = 116 \times 12.5^2 = 18100 \text{ N}$$

Thus, the buckling load and the permissible compressive and tensile load of the screw shaft are at least equal to the maximum axial load. Therefore, a Ball Screw that meets these requirements can be used without a problem.

## ● Studying the Permissible Rotational Speed

### ■ Maximum Rotational Speed

- Screw shaft diameter: 15mm; lead: 10mm

Maximum speed  $V_{\max}=0.3$  m/s

Lead  $Ph=10$  mm

$$N_{\max} = \frac{V_{\max} \times 60 \times 10^3}{Ph} = 1800 \text{ min}^{-1}$$

### ■ Permissible Rotational Speed Determined by the Dangerous Speed of the Screw Shaft

Factor according to the mounting method  $\lambda_2=15.1$  (see A-696)

Since the mounting method for the section between the nut and the bearing, where dangerous speed is to be considered, is "fixed-supported: "

Distance between two mounting surfaces  $l_b=700$  mm (estimate)

- Screw shaft diameter: 15mm; lead: 10mm

Screw-shaft thread minor diameter  $d_1=12.5$  mm

$$N_1 = \lambda_2 \times \frac{d_1}{l_b^2} 10^7 = 15.1 \times \frac{12.5}{700^2} \times 10^7 = 3852 \text{ min}^{-1}$$

### ■ Permissible Rotational Speed Determined by the DN Value

- Screw shaft diameter: 15mm; lead: 10mm (large lead Ball Screw)

Ball center-to-center diameter  $D=15.75$  mm

$$N_2 = \frac{70000}{D} = \frac{70000}{15.75} = 4444 \text{ min}^{-1}$$

Thus, the dangerous speed and the DN value of the screw shaft are met.

**[Selecting a Nut]**● **Selecting a Nut Model Number**

The Rolled Ball Screw with a screw shaft diameter of 15 mm and a lead of 10 mm is the following large-lead Rolled Ball Screw model.

BLK1510-5.6

( $C_a=9.8$  kN,  $C_{0a}=25.2$  kN)

● **Studying the Permissible Axial Load**

Assuming that an impact load is applied during an acceleration and a deceleration, set the static safety factor ( $f_s$ ) at 2 (see Table 18 on A-703).

$$F_{a_{\max}} = \frac{C_{0a}}{f_s} = \frac{25.2}{2} = 12.6 \text{ kN} = 12600 \text{ N}$$

The obtained permissible axial load is greater than the maximum axial load of 585 N, and therefore, there will be no problem with this model.

● **Studying the Service Life**■ **Calculating the Travel Distance**

Maximum speed  $V_{\max}=0.3$  m/s

Acceleration time  $t_1 = 0.2$  s

Deceleration time  $t_3 = 0.2$  s

● **Travel distance during acceleration**

$$l_{1,4} = \frac{V_{\max} \cdot t_1}{2} \times 10^3 = \frac{1.3 \times 0.2}{2} \times 10^3 = 30 \text{ mm}$$

● **Travel distance during uniform motion**

$$l_{2,5} = l_s - \frac{V_{\max} \cdot t_1 + V_{\max} \cdot t_3}{2} \times 10^3 = 600 - \frac{0.3 \times 0.2 + 0.3 \times 0.2}{2} \times 10^3 = 540 \text{ mm}$$

● **Travel distance during deceleration**

$$l_{3,6} = \frac{V_{\max} \cdot t_3}{2} \times 10^3 = \frac{0.3 \times 0.2}{2} \times 10^3 = 30 \text{ mm}$$

Based on the conditions above, the relationship between the applied axial load and the travel distance is shown in the table below.

Motion	Applied axial load $F_{a(N)}$	Travel distance $l_s(\text{mm})$
No1: During upward acceleration	585	30
No2: During upward uniform motion	510	540
No3: During upward deceleration	435	30
No4: During downward acceleration	395	30
No5: During downward uniform motion	470	540
No6: During downward deceleration	545	30

\* The subscript (N) indicates a motion number.

### ■Average Axial Load

$$F_m = \sqrt[3]{\frac{1}{2 \times l_s} (F_{a1}^3 \cdot l_1 + F_{a2}^3 \cdot l_2 + F_{a3}^3 \cdot l_3 + F_{a4}^3 \cdot l_4 + F_{a5}^3 \cdot l_5 + F_{a6}^3 \cdot l_6)} = 225 \text{ N}$$

### ■Nominal Life

Dynamic load rating	Ca= 9800 N
Load factor	f <sub>w</sub> = 1.5 (see Table19 on A-704)
Average load	F <sub>m</sub> = 492 N
Nominal life	L (rev)

$$L = \left( \frac{C_a}{f_w \cdot F_m} \right)^3 \times 10^6 = \left( \frac{9800}{1.5 \times 492} \right)^3 \times 10^6 = 2.34 \times 10^9 \text{ rev}$$

### ■Average Revolutions per Minute

Number of reciprocations per minute	n = 5 min <sup>-1</sup>
Stroke	l <sub>s</sub> =600 mm
Lead	Ph= 10 mm

$$N_m = \frac{2 \times n \times l_s}{Ph} = \frac{2 \times 5 \times 600}{10} = 600 \text{ min}^{-1}$$

### ■Calculating the Service Life Time on the Basis of the Nominal Life

Nominal life	L=2.34 × 10 <sup>9</sup> rev
Average revolutions per minute	N <sub>m</sub> = 600 min <sup>-1</sup>

$$L_h = \frac{L}{60 \cdot N_m} = \frac{2.34 \times 10^9}{60 \times 600} = 65000 \text{ h}$$

### ■Calculating the Service Life in Travel Distance on the Basis of the Nominal Life

Nominal life	L=2.34 × 10 <sup>9</sup> rev
Lead	Ph= 10 mm
L <sub>s</sub> = L × Ph × 10 <sup>-6</sup>	= 23400 km

With all the conditions stated above, model BLK1510-5.6 satisfies the desired service life time of 20,000 hours.

**[Studying the Rigidity]**

Since the conditions for selection do not include rigidity and this element is not particularly necessary, it is not described here.

**[Studying the Positioning Accuracy]****● Studying the Lead Angle Accuracy**

Accuracy grade C10 was selected in Section [Selecting Lead Angle Accuracy and Axial Clearance] on A-737.

C10 (travel distance error:  $\pm 0.21\text{mm}/300\text{mm}$ )

**● Studying the Axial Clearance**

Since the axial load is constantly present in a given direction only because of vertical mount, there is no need to study the axial clearance.

**● Studying the Axial Rigidity**

Since the lead angle accuracy is achieved beyond the required positioning accuracy, there is no need to study the positioning accuracy determined by axial rigidity.

**● Studying the Thermal Displacement through Heat Generation**

Since the lead angle accuracy is achieved beyond the required positioning accuracy, there is no need to study the positioning accuracy determined by the heat generation.

**● Studying the Orientation Change during Traveling**

Since the lead angle accuracy is achieved at a much higher degree than the required positioning accuracy, there is no need to study the positioning accuracy.

**[Studying the Rotational Torque]****● Frictional Torque Due to an External Load**

During upward uniform motion:

$$T_1 = \frac{F_{a2} \cdot Ph}{2 \times \pi \times \eta} = \frac{510 \times 10}{2 \times \pi \times 0.9} = 900 \text{ N} \cdot \text{mm}$$

During downward uniform motion:

$$T_2 = \frac{F_{a5} \cdot Ph}{2 \times \pi \times \eta} = \frac{470 \times 10}{2 \times \pi \times 0.9} = 830 \text{ N} \cdot \text{mm}$$

**● Torque Due to a Preload on the Ball Screw**

The Ball Screw is not provided with a preload.

### ● Torque Required for Acceleration

Inertial Moment:

Since the inertial moment per unit length of the screw shaft is  $3.9 \times 10^{-4} \text{ kg} \cdot \text{cm}^2/\text{mm}$  (see the specification table), the inertial moment of the screw shaft with an overall length of 800mm is obtained as follows.

$$J_s = 3.9 \times 10^{-4} \times 800 = 0.31 \text{ kg} \cdot \text{cm}^2 \\ = 0.31 \times 10^{-4} \text{ kg} \cdot \text{m}^2$$

$$J = (m_1 + m_2) \left( \frac{Ph}{2 \times \pi} \right)^2 \cdot A^2 \times 10^{-6} + J_s \cdot A^2 = (40 + 10) \left( \frac{10}{2 \times \pi} \right)^2 \times 1^2 \times 10^{-6} + 0.31 \times 10^{-4} \times 1^2 \\ = 1.58 \times 10^{-4} \text{ kg} \cdot \text{m}^2$$

Angular acceleration:

$$\omega' = \frac{2\pi \cdot \text{Nm}}{60 \cdot t} = \frac{2\pi \times 1800}{60 \times 0.2} = 942 \text{ rad/s}^2$$

Based on the above, the torque required for acceleration is obtained as follows.

$$T_3 = (J + J_m) \cdot \omega' = (1.58 \times 10^{-4} + 5 \times 10^{-6}) \times 942 = 0.2 \text{ N} \cdot \text{m} = 200 \text{ N} \cdot \text{mm}$$

Therefore, the required torque is specified as follows.

During upward acceleration:

$$T_{K1} = T_1 + T_3 = 900 + 200 = 1100 \text{ N} \cdot \text{mm}$$

During upward uniform motion:

$$T_{11} = T_1 = 900 \text{ N} \cdot \text{mm}$$

During upward deceleration:

$$T_{g1} = T_1 - T_3 = 900 - 200 = 700 \text{ N} \cdot \text{mm}$$

During downward acceleration:

$$T_{K2} = 630 \text{ N} \cdot \text{mm}$$

During downward uniform motion:

$$T_{12} = 830 \text{ N} \cdot \text{mm}$$

During downward deceleration:

$$T_{g2} = 1030 \text{ N} \cdot \text{mm}$$

**[Studying the Driving Motor]****● Rotational Speed**

Since the Ball Screw lead is selected based on the rated rotational speed of the motor, it is unnecessary to study the rotational speed of the motor.

Maximum working rotational speed:  $1800 \text{ min}^{-1}$

Rated rotational speed of the motor:  $3000 \text{ min}^{-1}$

**● Minimum Feed Amount**

As with the rotational speed, the Ball Screw lead is selected based on the encoder normally used for an AC servomotor. Therefore, it is unnecessary to study this factor.

Encoder resolution:  $1000 \text{ p/rev}$ .

**● Motor Torque**

The torque during acceleration calculated in Section [Studying the Rotational Torque] on A-743 is the required maximum torque.

$$T_{\max} = T_{k1} = 1100 \text{ N} \cdot \text{mm}$$

Therefore, the maximum peak torque of the AC servomotor needs to be at least  $1100 \text{ N} \cdot \text{mm}$ .

**● Effective Torque Value**

The selection requirements and the torque calculated in Section [Studying the Rotational Torque] on A-743 can be expressed as follows.

During upward acceleration:

$$T_{k1} = 1100 \text{ N} \cdot \text{mm}$$

$$t_1 = 0.2 \text{ s}$$

During upward uniform motion:

$$T_{t1} = 900 \text{ N} \cdot \text{mm}$$

$$t_2 = 1.8 \text{ s}$$

During upward deceleration:

$$T_{g1} = 700 \text{ N} \cdot \text{mm}$$

$$t_3 = 0.2 \text{ s}$$

During downward acceleration:

$$T_{k2} = 630 \text{ N} \cdot \text{mm}$$

$$t_1 = 0.2 \text{ s}$$

During downward uniform motion:

$$T_{t2} = 830 \text{ N} \cdot \text{mm}$$

$$t_2 = 1.8 \text{ s}$$

During downward deceleration:

$$T_{g2} = 1030 \text{ N} \cdot \text{mm}$$

$$t_3 = 0.2 \text{ s}$$

When stationary ( $m=0$ ):

$$T_s = 658 \text{ N} \cdot \text{mm}$$

$$t_4 = 7.6 \text{ s}$$

The effective torque is obtained as follows, and the rated torque of the motor must be 743 N•mm or greater.

$$T_{rms} = \sqrt{\frac{T_{k1}^2 \cdot t_1 + T_{t1}^2 \cdot t_2 + T_{g1}^2 \cdot t_3 + T_{k2}^2 \cdot t_1 + T_{t2}^2 \cdot t_2 + T_{g2}^2 \cdot t_3 + T_s^2 \cdot t_4}{t_1 + t_2 + t_3 + t_1 + t_2 + t_3 + t_4}}$$

$$= \sqrt{\frac{1100^2 \times 0.2 + 900^2 \times 1.8 + 700^2 \times 0.2 + 630^2 \times 0.2 + 830^2 \times 1.8 + 1030^2 \times 0.2 + 658^2 \times 7.6}{0.2 + 1.8 + 0.2 + 0.2 + 1.8 + 0.2 + 7.6}}$$

$$= 743 \text{ N} \cdot \text{mm}$$

#### ● Inertial Moment

The inertial moment applied to the motor equals to the inertial moment calculated in Section [Studying the Rotational Torque] on A-743.

$$J = 1.58 \times 10^{-4} \text{ kg} \cdot \text{m}^2$$

Normally, the motor needs to have an inertial moment at least one tenth of the inertial moment applied to the motor, although the specific value varies depending on the motor manufacturer.

Therefore, the inertial moment of the AC servomotor must be  $1.58 \times 10^{-5} \text{ kg} \cdot \text{m}^2$  or greater.

The selection has been completed.

Ball Screw

## Structure and Features

The use of a ball cage in the Ball Screw with the Ball Cage eliminates collision and friction between balls and increases the grease retention. This makes it possible to achieve a low noise, a low torque fluctuation and a long-term maintenance-free operation.

In addition, this Ball Screw is superbly capable of responding to the high speed because of an ideal ball recirculation structure, a strengthened circulation path and an adoption of the ball cage.

## Ball Cage Effect

### [Low Noise, Acceptable Running Sound]

The use of the ball cage eliminates the collision noise between the balls. Additionally, as balls are picked up in the tangential direction, the collision noise from the ball circulation has also been eliminated.

### [Long-term Maintenance-free Operation]

The friction between the balls has been eliminated, and the grease retention has been improved through the provision of grease pockets. As a result, the long-term maintenance-free operation (i.e., lubrication is unnecessary over a long period) is achieved.

### [Smooth Motion]

The use of a ball cage eliminates the friction between the balls and minimizes the torque fluctuation, thus allowing the smooth motion to be achieved.

[Low Noise]

● **Noise Level Data**

Since the balls in the Ball Screw with the Ball Cage do not collide with each other, they do not produce a metallic sound and a low noise level is achieved.

■ **Noise Measurement**

[Conditions]

Item	Description
Sample	High load ball screw with ball cage HBN3210-5 Conventional type: model BNF3210-5
Stroke	600mm
Lubrication	Grease lubrication (lithium-based grease containing extreme pressure agent)

Ball Screw

---

## Types and Features

---

[Preload Type]

### Model SBN

[Specification Table⇒B-576](#)

Model SBN has a circulation structure where balls are picked up in the tangential direction and is provided with a strengthened circulation path, thus to achieve a DN value of 130,000.

---

### Model SBK

[Specification Table⇒B-578](#)

As a result of adopting the offset preloading method, which shifts two rows of grooves of the ball screw nut, a compact structure is achieved.

[No Preload Type]

### Model HBN

[Specification Table⇒B-580](#)

With the optimal design for high loads, this Ball Screw model achieves a rated load more than twice the conventional type.

▶▶▶ [B-584](#)

## Features of Each Model

### Standard-Stock Precision Ball Screw (Unfinished Shaft Ends)

## Structure and Features

This type of Ball Screw is mass manufactured by cutting the standardized screw shafts of Precision Ball Screws to regular lengths. Additional machining of the shaft ends can easily be performed.

To meet various intended purposes, THK offers several Ball Screw models with different types of nuts: the double-nut type (model BNFN), the single-nut type (model BNF), the offset preload-nut type (model BIF) and the miniature Ball Screw (models MDK and MBF).

### [Contamination Protection]

Nuts of the following model numbers are attached with a labyrinth seal.

- All variations of models BNFN, BNF and BIF
- Model MDK0802/1002/1202/1402/1404/1405

When dust or other foreign materials may enter the Ball Screw, it is necessary to use a contamination protection device (e.g., bellows) to completely protect the screw shaft.

### [Lubrication]

The ball screw nuts are supplied with lithium soap-group grease with shipments.

(Models MDK and MBF are applied only with an anti-rust oil.)

### [Additional Machining of the Shaft End]

Since only the effective thread of the screw shaft is surface treated with induction-hardening (all variations of models BNFN, BNF and BIF; model MDK 1405) or carburizing (all variations of model MBF; model MDK0401 to 1404), the shaft ends can additionally be machined easily either by grinding or milling.

In addition, since both ends of the screw shaft have a center hole, they can be cylindrically ground.

Surface hardness of the effect thread : HRC58 to 64

Hardness of the screw shaft ends

All variation of models BNFN, BNF and BIF; model MDK 1405 : HRC22 to 27

All variations of model MBF; model MDK0401 to 1404 : HRC35 or below

THK has standardized the shapes of the screw shaft ends in order to allow speedy estimation and manufacturing of the Ball Screws.

The shapes of shaft ends are divided into those allowing the standard support units to be used (symbols H, K and J) and those compliant with JIS B 1192-1997 (symbols A, B and C). See A-810 for details.

---

## Types and Features

---

[Preload Type]

### Model BIF

[Specification Table⇒B-594](#)

The right and left screws are provided with a phase in the middle of the ball screw nut, and an axial clearance is set at a below-zero value (under a preload). This compact model is capable of a smooth motion.

---

### Model BNFN

[Specification Table⇒B-594](#)

The most common type with a preload provided via a spacer between the two combined ball screw nuts to eliminate backlash. It can be mounted using the bolt holes drilled on the flange.

dammy

**Features of Each Model****Standard-Stock Precision Ball Screw (Unfinished Shaft Ends)**

dammy

**[No Preload Type]****Models MDK and MBF****Specification Table⇒B-584**

A miniature type with a screw shaft diameter of  $\phi 4$  to  $\phi 14$  mm and a lead of 1 to 5mm.

**Model BNF****Specification Table⇒B-594**

The simplest type with a single ball screw nut. It is designed to be mounted using the bolt holes drilled on the flange.

Table of Ball Screw Types with Finished Shaft Ends and the Corresponding Support Units and Nut Brackets

▶▶▶ **A-762**

**[Dimensional Drawing, Dimensional Table](#)**

▶▶▶ **B-608**

## Features of Each Model

### Standard-Stock Precision Ball Screw (Finished Shaft Ends)

## Features

To meet the space-saving requirement, this type of Ball Screw has a standardized screw shaft and a ball screw nut. The ends of the screw shaft are standardized to fit the corresponding support unit. The shaft support method with models BNK0401, 0501 and 0601 is "fixed-free," while other models use the "fixed-supported" method with the shaft directly coupled with the motor.

Screw shafts and nuts are compactly designed. When a support unit and a nut bracket are combined with a Ball Screw, the assembly can be mounted on your machine as it is. Thus, a high-accuracy feed mechanism can easily be achieved.

### [Contamination Protection and Lubrication]

Each ball screw nut contains a right amount of grease. In addition, the ball nuts of model BNK0802 or higher contain a labyrinth seal (with models BNK1510, BNK1520, BNK1616, BNK2020 and BNK2520, the end cap also serves as a labyrinth seal).

When foreign materials may enter the screw nut, it is necessary to use a dust-prevention device (e.g., bellows) to completely protect the screw shaft.

## Types and Features

### Model BNK

[Specification Table⇒B-608](#)

For this model, screw shafts with a diameter  $\phi 4$  to  $\phi 25$  mm and a lead 1 to 20 mm are available as the standard.

## Features of Each Model

### Precision Ball Screw

For THK Precision Ball Screws, a wide array of precision-ground screw shafts and ball screw nuts are available as standard to meet diversified applications.

## Structure and Features

### [Combinations of Various shaft Diameters and Leads]

You can select the combination of a shaft diameter and a lead that meet the intended use from the various nut types and the screw shaft leads. Those nut types include the return-pipe nuts, which represent the most extensive variations among the series, the compact simple nuts and the large-lead end-cap nuts.

### [Standard-stock Types (with Unfinished Shaft Ends/Finished Shaft Ends) are Available]

The unfinished shaft end types, which are mass manufactured by cutting the standardized screw shafts to the standard lengths, and those with finished shaft ends, for which the screw shaft ends are machined to match the corresponding the support units, are available as the standard.

### [Accuracy Standards Compliant with JIS (ISO)]

The accuracy of the Ball Screw is controlled in accordance with the JIS standards (JIS B1192-1997).

	Precision Ball Screw						Rolled Ball Screw	
Accuracy grades	C0	C1	C2	C3	C5	C7	C8	C10

Type	Series symbol	Grade	Remarks
For positioning	C	0, 1, 3, 5	JIS series
	Cp	1, 3, 5	ISO compliant
For conveyance	Ct	1, 3, 5, 7, 10	

### [Options that Meet the Environment are Available]

Options are available consisting of a lubricator (QZ), which enables the maintenance interval to be significantly extended, and a wiper ring (W), which improves the ability to remove foreign materials in adverse environments.

**[Structure and Features of Offset Preload Type Simple-Nut Ball Screw Model DIK]**

The Simple-Nut Ball Screw model DIK is an offset preload type in which a phase is provided in the middle of a single ball screw nut, and an axial clearance is set at a below-zero value (under a preload).

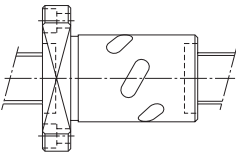

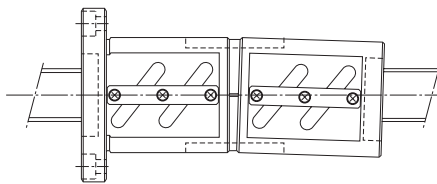

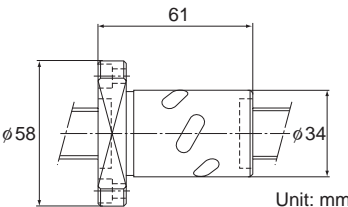

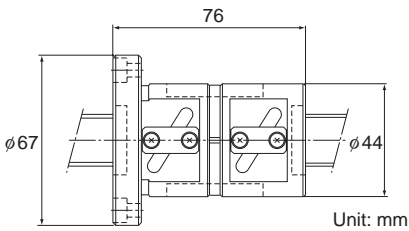

Model DIK has a more compact structure and allows smoother motion than the conventional double-nut type (spacer inserted between two nuts).

**[Comparison between the Simple Nut and the Double-Nuts]**

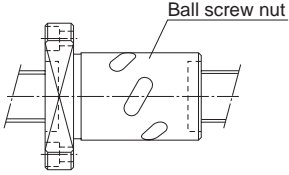

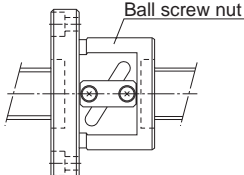

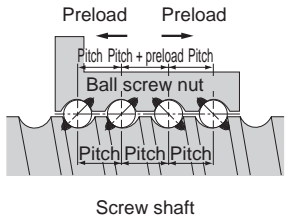

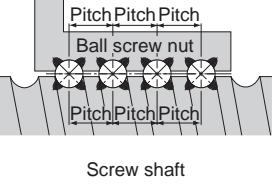

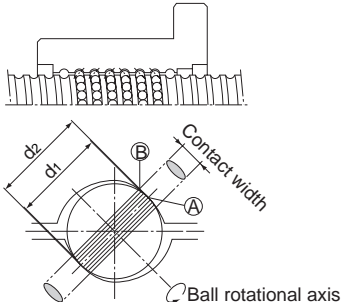

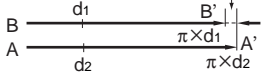

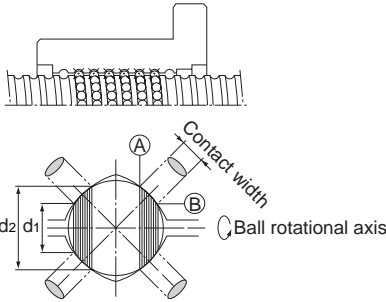

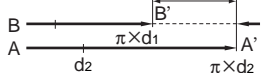

**Features of Each Model**

**Precision Ball Screw**

Simple-Nut Ball Screw Model DIK	Conventional Double-Nut Type Ball Screw Model BNFN
<b>Rotational Performance</b>	
<p>The preload adjustment with Simple Nut Ball Screw model DIK is performed according to the ball diameter. This eliminates the inconsistency in the contact angle, which is the most important factor of the Ball Screw performance. It also ensures the high rigidity, the smooth motion and the high wobbling accuracy.</p> 	<p>The use of a spacer in the double-nuts tends to cause inconsistency in the contact angle due to inaccurate flatness of the spacer surface and an inaccurate perpendicularity of the nut. This results in a non-uniform ball contact, an inferior rotational performance and a low wobbling accuracy.</p> 
<b>Dimensions</b>	
<p>Since Simple-Nut Ball Screw model DIK is based on a preloading mechanism that does not require a spacer, the overall nut length can be kept short. As a result, the whole nut can be lightly and compactly designed.</p>  <p style="text-align: center;">Unit: mm</p> <p style="text-align: center;">Model DIK 2005-6</p>	 <p style="text-align: center;">Unit: mm</p> <p style="text-align: center;">Model BNFN 2005-2.5</p>

[Comparison between the Offset Preload Type of Simple-Nut Ball Screw and the Oversize Preload Nut Ball Screw]

Simple-Nut Ball Screw Model DIK	Conventional Oversize Preload Nut Ball Screw Model BNF
	
<b>Preloading Structure</b>	
	
<b>Accuracy Life</b>	
<p>Simple-Nut Ball Screw model DIK has a similar preloading structure to that of the double-nut type although the former only has one ball screw shaft. As a result, no differential slip or spin occurs, thus to minimize the increase in the rotational torque and the generation of heat. Accordingly, a high level of accuracy can be maintained over a long period.</p> <p style="text-align: center;">2 point contact structure</p>  <div style="text-align: center;"> <p>Differential slip</p>  </div>	<p>With the oversize preload nut Ball Screw, a preload is provided through the balls each in contact with the raceway at four points. This causes differential slip and spin to increase the rotational torque, resulting in an accelerated wear and a heat generation. Therefore, the accuracy deteriorates in a short period.</p> <p style="text-align: center;">4 point contact structure</p>  <div style="text-align: center;"> <p>Differential slip</p>  </div>

## Types and Features

[Preload Type]

### Model BIF

The right and the left screws are provided with a phase in the middle of the ball screw nut, and an axial clearance is set at a below-zero value (under a preload). This compact model is capable of a smooth motion.

Specification Table⇒B-652

### Model DIK

The right and the left screws are provided with a phase in the middle of the ball screw nut, and an axial clearance is set at a below-zero value (under a preload). This compact model is capable of a smooth motion.

Specification Table⇒B-652

### Model BNFN

The most common type with a preload provided via a spacer between the two combined ball screw nuts to eliminate the backlash. It can be mounted using the bolt holes drilled on the flange.

Specification Table⇒B-652

### Model DKN

A preload is provided via a spacer between the two combined ball screw nuts to achieve a below-zero axial clearance (under a preload).

Specification Table⇒B-672

## Model BLW

[Specification Table⇒B-652](#)

Since a preload is provided through a spacer between two large lead nuts, high-speed feed without backlash is ensured.

[No Preload Type]

## Model BNF

[Specification Table⇒B-686](#)

The simplest type with a single ball screw nut. It is designed to be mounted using the bolt holes drilled on the flange.

## Model DK

[Specification Table⇒B-686](#)

The most compact type, with a ball screw nut diameter 70 to 80% of that of the return-pipe nut.

## Model MDK

[Specification Table⇒B-686](#)

This model is a miniature nut with a screw shaft diameter of  $\phi 4$  to 14 mm and a lead of 1 to 5 mm.

## Features of Each Model

### Precision Ball Screw

## Models BLK/WGF

[Specification Table](#)⇒B-686

With model BLK, the shaft diameter is equal to the lead dimension. Model WGF has a lead dimension 1.5 to 3 times longer than the shaft diameter.

## Square Ball Screw Nut Model BNT

[Specification Table](#)⇒B-716

Since mounting screw holes are machined on the square ball screw nut, this model can compactly be mounted on the machine without a housing.

## Structure and Features

### [Model DIR]

Standard-Lead Rotary-Nut Ball Screw model DIR is a rotary-nut Ball Screw that has a structure where a simple-nut Ball Screw is integrated with a support bearing.

Its ball screw nut serves as a ball recirculation structure using deflectors. Balls travel along the groove of the deflector mounted in the ball screw nut to the adjacent raceway, and then circulate back to the loaded area to complete an infinite rolling motion.

Being an offset preload nut, the single ball screw nut provides different phases to the right and left thread in the middle of the nut, thus to set the axial clearance below zero (a preload is provided). This allows more compact, smoother motion to be achieved than the conventional double-nut type (a spacer is inserted between two nuts).

The support bearing comprises of two rows of DB type angular bearings with a contact angle of  $45^\circ$  to provide a preload. The collar, previously used to mount a pulley, is integrated with the ball screw nut. (See the A section.)

Fig.1 Structure of the Support Bearing

### ● Compact

Because of the internal circulation mechanism using a deflector, the outer diameter is only 70 to 80%, and the overall length is 60 to 80%, of that of the return-pipe nut, thus to reduce the weight and decrease the inertia during acceleration.

Since the nut and the support bearing are integrated, a highly accurate, and a compact design is achieved.

In addition, small inertia due to the lightweight ball screw nut ensures high responsiveness.

### ● Capable of Fine Positioning

Being a Standard-Lead Ball Screw, it is capable of fine positioning despite that the ball screw nut rotates.

### ● Accuracy can Easily be Established

As the support bearing is integrated with the outer ring, the bearing can be assembled with the nut housing on the end face of the outer ring flange. This makes it easy to center the ball screw nut and establish accuracy.

### ● Well Balanced

Since the deflector is evenly placed along the circumference, a superb balance is ensured while the ball screw nut is rotating.

### ● **Stability in the Low-speed Range**

Traditionally, motors tend to have an uneven torque and a speed in the low-speed range due to the external causes. With model DIR, the motor can be connected independently with the screw shaft and the ball screw nut, thus to allow micro feeding within the motor's stable rotation range.

#### [Model BLR]

The Rotary Ball Screw is a rotary-nut ball screw unit that has an integrated structure consisting of a ball screw nut and a support bearing. The support bearing is an angular bearing that has a contact angle of 60°, contains an increased number of balls and achieves large axial rigidity.

Model BLR is divided into two types: Precision Ball Screw and Rolled Screw Ball.

### ● **Smooth Motion**

It achieves smoother motion than rack-and-pinion based straight motion. Also, since the screw shaft does not rotate because of the ball screw nut drive, this model does not show skipping, produces low noise and generates little heat.

### ● **Low Noise even in High-speed Rotation**

Model BLR produces very low noise when the balls are picked up along the end cap. In addition, the balls circulate by passing through the ball screw nut, allowing this model to be used at high speed.

### ● **High Rigidity**

The support bearing of this model is larger than that of the screw shaft rotational type. Thus, its axial rigidity is significantly increased.

### ● **Compact**

Since the nut and the support bearing are integrated, a highly accurate, and a compact design is achieved.

### ● **Easy Installation**

By simply mounting this model to the housing with bolts, a ball screw nut rotating mechanism can be obtained. (For the housing's inner-diameter tolerance, H7 is recommended.)

## Structure and Features

The Ball Screw/Spline contains the Ball Screw grooves and the Ball Spline groove crossing one another. The nuts of the Ball Screw and the Ball Spline have dedicated support bearings directly embedded on the circumference of the nuts.

The Ball Screw/Spline is capable of performing three (rotational, linear and spiral) modes of motion with a single shaft by rotating or stopping the spline nut.

It is optimal for machines using a combination of rotary and straight motions, such as scholar robot's Z-axis, assembly robot, automatic loader, and machining center's ATC equipment.

### [Zero Axial Clearance]

The Ball Spline has an angular-contact structure that causes no backlash in the rotational direction, enabling highly accurate positioning.

### [Lightweight and Compact]

Since the nut and the support bearing are integrated, highly accurate, compact design is achieved. In addition, small inertia because of the lightweight ball screw nut ensures high responsiveness.

### [Easy Installation]

The Ball Spline nut is designed so that balls do not fall off even if the spline nut is removed from the shaft, making installation easy. The Ball Screw/Spline can easily be mounted simply by securing it to the housing with bolts. (For the housing's inner-diameter tolerance, H7 is recommended.)

### [Smooth Motion with Low Noise]

As the Ball Screw is based on an end cap mechanism, smooth motion with low noise is achieved.

### [Highly Rigid Support Bearing]

The support bearing on the Ball Screw has a contact angle of  $60^\circ$  in the axial direction while that on the Ball Spline has a contact angle of  $30^\circ$  in the moment direction, thus to provide a highly rigid shaft support.

In addition, a dedicated rubber seal is attached as standard to prevent entry of foreign materials.

## Structure and Features

THK Rolled Ball Screws are low priced feed screws that use a screw shaft rolled with high accuracy and specially surface-ground, instead of a thread-ground shaft used in the Precision Ball Screws.

The ball raceways of the ball screw nut are all thread-ground, thus to achieve a smaller axial clearance and smoother motion than the conventional rolled ball screw.

In addition, a wide array of types are offered as standard in order to allow optimal products to be selected according to the application.

### [Achieves Lead Angle Accuracy of Class C7]

Screw shafts with travel distance error of classes C7 and C8 are also manufactured as the standard in addition to class C10 to meet a broad range of applications.

Travel distance      C7:  $\pm 0.05/300$  (mm)

                            C8:  $\pm 0.10/300$  (mm)

                            C10:  $\pm 0.21/300$  (mm)

(For maximum length of screw shaft by accuracy grade, see A-691.)

### [Achieves Roughness of the Ball Raceways of the Screw Shaft at 0.20 $\mu$ or Less]

The surface of the screw shaft's ball raceways is specially ground after the shaft is rolled to ensure surface roughness of 0.20  $\mu$  or less, which is equal to that of the ground thread of the Precision Ball Screw.

### [The Ball Raceways of the Ball Screw Nut are All Finished by Grinding]

THK finishes the ball raceways of Rolled Ball Screw nuts by grinding, just as the Precision Ball Screws, to secure the durability and the smooth motion.

### [Low Price]

The screw shaft is induction-hardened or carburized after being rolled, and its surface is then specially ground. This allows the rolled Ball Screw to be priced lower than the Precision Ball Screw with a ground thread.

### [High Dust-prevention Effect]

The ball screw nut is incorporated with a compact labyrinth seal or a brush seal. This achieves a low friction, a high dust-prevention effect and a longer service life of the Ball Screw.

## Types and Features

[Preload Type]

### Model JPF

This model achieves a zero-backlash through a constant preloading method by shifting the phase with the central part of a simple nut as the spring structure.

The constant preload method allows the ball screw to absorb a pitch error and achieve a smooth motion.

[Specification Table⇒B-736](#)

Axial clearance: 0 or less

[No Preload Type]

### Model BTK

A compact type with a round nut incorporated with a return pipe. The flange circumference is cut flat at the top and bottom, allowing the shaft center to be positioned lower.

[Specification Table⇒B-738](#)

### Model MTF

A miniature type with a screw shaft diameter of  $\phi 6$  to  $\phi 12$  mm and a lead of 1 to 2 mm.

[Specification Table⇒B-738](#)

## Features of Each Model

### Rolled Rotary Ball Screw

## Structure and Features

The Rotary Ball Screw is a rotary-nut ball screw unit that has an integrated structure consisting of a ball screw nut and a support bearing. The support bearing is an angular bearing that has a contact angle of 60°, contains an increased number of balls and achieves a large axial rigidity.

Model BLR is divided into two types: the Precision Ball Screw and the Rolled Screw Ball.

#### [Smooth Motion]

It achieves smoother motion than the rack-and-pinion based straight motion. Also, since the screw shaft does not rotate because of the ball screw nut drive, this model does not show skipping, produces low noise and generates little heat.

#### [Low Noise even in High-speed Rotation]

Model BLR produces very low noise when the balls are picked up along the end cap. In addition, the balls circulate by passing through the ball screw nut, allowing this model to be used at high speed.

#### [High Rigidity]

The support bearing of this model is larger than that of the screw shaft rotational type. Thus, its axial rigidity is significantly increased.

#### [Compact]

Since the nut and the support bearing are integrated, a highly accurate, and a compact design is achieved.

#### [Easy Installation]

By simply mounting this model to the housing using bolts, a ball screw nut rotating mechanism can be obtained. (For the housing's inner-diameter tolerance, H7 is recommended.)

Ball Screw

# Ball Screw Peripherals

# Support Unit

Models EK, BK, FK, EF, BF and FF

Fig.1 Structure of the Support Unit

## Structure and Features

The Support Unit comes in six types: models EK, FK, EF, and FF, which are standardized for the standard Ball Screw assembly provided with the finished shaft ends, and models BK and BF, which are standardized for ball screws in general.

The Support Unit on the fixed side contains a JIS Class 5-compliant angular bearing provided with an adjusted preload. The miniature type Support Unit models EK/FK 4, 5, 6 and 8, in particular, incorporate a miniature bearing with a contact angle of 45° developed exclusively for miniature Ball Screws. This provides stable rotational performance with a high rigidity and an accuracy.

The Support Unit on the supported side uses a deep-groove ball bearing.

The internal bearings of the Support Unit models EK, FK and BK contain an appropriate amount of lithium soap-group grease that is sealed with a special seal. Thus, these models are capable of operating over a long period.

## Ball Screw Peripherals

### Support Unit

#### [Uses the Optimal Bearing]

To ensure the rigidity balance with the Ball Screw, the Support Unit uses an angular bearing (contact angle: 30°; DF configuration) with a high rigidity and a low torque. Miniature Support Unit models EK/FK 4, 5, 6 and 8 are incorporated with a miniature angular bearing with a contact angle of 45° developed exclusively for miniature Ball Screws. This bearing has a greater contact angle of 45° and an increased number of balls with a smaller diameter. The high rigidity and accuracy of the miniature angular bearing provides the stable rotational performance.

#### [Support Unit Shapes]

The square and round shapes are available for the Support Unit to allow the selection according to the intended use.

#### [Compact and Easy Installation]

The Support Unit is compactly designed to accommodate the space in the installation site. As the bearing is provided with an appropriately adjusted preload, the Support Unit can be assembled with a Ball Screw unit with no further machining. Accordingly, the required man-hours in the assembly can be reduced and the assembly accuracy can be increased.

## Example of Installation

### [Square Type Support Unit]

Fig.2 Example of Installing a Square Type Support Unit

### [Round Type Support Unit]

Fig.3 Example of Installing a Round Type Support Unit

## Mounting Procedure

### [Installing the Support Unit]

- (1) Install the fixed side Support Unit with the screw shaft.
- (2) After inserting the fixed side Support Unit, secure the lock nut using the fastening set piece and the hexagonal socket-head setscrews.
- (3) Attach the supported side bearing to the screw shaft and secure the bearing using the snap ring, and then install the assembly to the housing on the supported side.

Note1) Do not disassemble the Support Unit.

Note2) When inserting the screw shaft to the Support Unit, take care not to let the oil seal lip turn outward.

Note3) When securing the set piece with a hexagonal socket-head setscrew, apply an adhesive to the hexagonal socket-head setscrew before tightening it in order to prevent the screw from loosening. If planning to use the product in a harsh environment, it is also necessary to take a measure to prevent other components/parts from loosening. Contact THK for details.

### [Installation onto the Table and the Base]

- (1) If using a bracket when mounting the ball screw nut to the table, insert the nut into the bracket and temporarily fasten it.
- (2) Temporarily fasten the fixed side Support Unit to the base. In doing so, press the table toward the fixed side Support Unit to align the axial center, and adjust the table so that it can travel freely.
  - If using the fixed side Support Unit as the reference point, secure a clearance between the ball screw nut and the table or inside the bracket when making adjustment.
  - If using the table as the reference point, make the adjustment either by using the shim (for a square type Support Unit), or securing the clearance between the outer surface of the nut and the inner surface of the mounting section (for a round type Support Unit).
- (3) Press the table toward the fixed-side Support Unit to align the axial center. Make the adjustment by reciprocating the table several times so that the nut travels smoothly throughout the whole stroke, and temporarily secure the Support Unit to the base.

### [Checking the Accuracy and Fully Fastening the Support Unit]

While checking the runout of the ball screw shaft end and the axial clearance using a dial gauge, fully fasten the ball screw nut, the nut bracket, the fixed side Support Unit and the supported-side Support Unit, in this order.

### [Connection with the Motor]

- (1) Mount the motor bracket to the base.
- (2) Connect the motor and the ball screw using a coupling.

Note) Make sure the mounting accuracy is maintained.

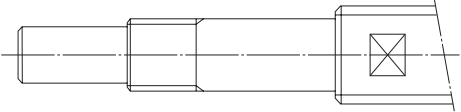

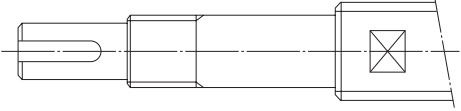

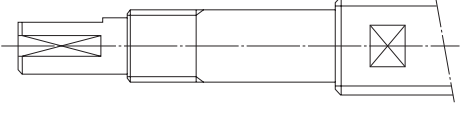

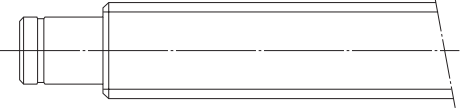

- (3) Thoroughly perform the break-in for the system.

## Types of Recommended Shapes of the Shaft Ends

To ensure speedy estimates and manufacturing of Ball Screws, THK has standardized the shaft end shapes of the screw shafts. The recommended shapes of shaft ends consist of shapes H, K and J, which allow standard Support Units to be used.

Mounting method	Symbol for shaft end shape		Shape	Supported Support Unit
Fixed	H J	H1		FK EK
		J1		BK
		H2		FK EK
		J2		BK
		H3		FK EK
		J3		BK

# Nut bracket

## Model MC

Fig.1 Structure of the Nut Bracket

## Structure and Features

The Nut Bracket is standardized for the standard Ball Screw assembly provided with finished shaft ends. It is designed to be secured directly on the table with bolts. Since the height is low, it can be mounted on the table only using bolts.

## Type

## Nut Bracket Model MC

Specification Table⇒B-774

# Lock nut

## Model RN

Fig.1 Structure of the Lock Nut

## Structure and Features

The Lock Nut for the Ball Screws is capable of fastening the screw shaft and the bearing with a high accuracy.

The provided hexagonal socket-head setscrew and the set piece prevent the Lock Nut from loosening and ensure firm fastening. The Lock Nut comes in various types ranging from model M4 to model M40.

## Type

## Lock Nut Model RN

Specification Table⇒B-776

## Ball Screw Options

## Lubrication

To maximize the performance of the Ball Screw, it is necessary to select a lubricant and a lubrication method according to the conditions.

For types of lubricants, characteristics of lubricants and lubrication methods, see the section on "Accessories for Lubrication" on A-954.

Also, QZ Lubricator is available as an optional accessory that significantly increases the maintenance interval.

## Corrosion Prevention (Surface Treatment, etc.)

Depending on the service environment, the Ball Screw requires anticorrosive treatment or a different material. For details of an anticorrosive treatment and a material change, contact THK. (see A-18)

## Contamination Protection

The dust and foreign materials that enter the Ball Screw may cause accelerated wear and breakage, as with roller bearings. Therefore, on parts where contamination by dust or foreign materials (e.g., cutting chips) is predicted, screw shafts must always be completely covered by contamination protection devices (e.g., bellows, screw cover, wiper ring).

If the Ball Screw is used in an atmosphere free from the foreign materials but with suspended dust, a labyrinth seal (for precision Ball Screws) with symbol RR and a brush seal (for rolled Ball Screws) with symbol ZZ can be used as contamination protection devices.

The labyrinth seal is designed to maintain a slight clearance between the seal and the screw shaft raceway so that torque does not develop and no heat is generated, though its effect in contamination protection is limited.

With Ball Screws except the large lead and super lead types, there is no difference in nut dimensions between those with and without a seal.

With the wiper ring, special resin with high wear resistance and low dust generation removes foreign materials while closely contacting the circumference of the ball screw shaft and the screw thread. It is capable of preventing foreign materials from entering the Ball Screw even in a severe environment.

Fig.1 Contamination Protection Cover

# QZ Lubricator

- For the supported models and the ball screw nut dimension with QZ attached, see B-778 to B-783.

QZ Lubricator feeds a right amount of lubricant to the ball raceway of the ball screw shaft. This allows an oil film to be constantly formed between the balls and the raceway, improves lubrications and significantly extends the lubrication maintenance interval.

The structure of QZ Lubricator consists of three major components: (1) a heavily oil-impregnated fiber net (stores the lubricant), (2) a high-density fiber net (applies the lubricant to the raceway) and (3) an oil-control plate (adjusts the oil flow). The lubricant contained in the QZ Lubricator is fed by the capillary phenomenon, which is used also in felt pens and many other products.

Appearance Drawing

Structural Drawing

## [Features]

- Since it supplements an oil loss, the lubrication maintenance interval can be significantly extended.
- Since the right amount of lubricant is applied to the ball raceway, an environmentally friendly lubrication system that does not contaminate the surroundings is achieved.

Note) QZ Lubricator has a vent hole. Do not block the hole with grease or the like.

● **Significantly extended maintenance interval**

Since QZ Lubricator continuously feeds a lubricant over a long period, the maintenance interval can be extended significantly.

[Test conditions]

Item	Description
Ball Screw	BIF2510
Maximum rotational speed	2500min <sup>-1</sup>
Maximum speed	25m/min
Stroke	500mm
Load	Internal preload only

● **Environmentally friendly lubrication system**

Since the QZ Lubricator feeds the right amount of lubricant directly to the raceway, the lubricant can effectively be used without waste.

**QZ Lubricator + THK AFA Grease**  
**32cm<sup>3</sup>**  
 (QZ Lubricator attached to both ends of the ball screw nut)

**Forced lubrication**  
**0.25cm<sup>3</sup>/3min×24h×125d**  
**=15000cm<sup>3</sup>**

Reduced to approx.  $\frac{1}{470}$

# Wiper Ring W

- For the supported models and the ball screw nut dimension with Wiper Ring W attached, see B-778 to B-783.

With the wiper ring W, special resin with a high wear resistance and a low dust generation which removes and prevents foreign materials from entering the ball screw nut while elastically contacting the circumference of the ball screw shaft and the screw thread.

## [Features]

- A total of eight slits on the circumference remove foreign materials in succession, and prevent entrance of foreign material.
- Contacts the ball screw shaft to reduce the flowing out of grease.
- Contacts the ball screw shaft at a constant pressure level using a spring, thus to minimize the heat generation.
- Since the material is highly resistant to the wear and the chemicals, its performance will not easily be deteriorated even if it is used over a long period.

● **Test in an environment exposed to contaminated environment**

[Test conditions]

Item	Description
Model No.	BIF3210-5G0+1500LC5
Maximum rotational speed	1000min <sup>-1</sup>
Maximum speed	10m/min
Maximum circumferential speed	1.8m/s
Time constant	60ms
Dowel	1s
Stroke	900mm
Load (through internal load)	1.31kN
Grease	THK AFG Grease 8cm <sup>3</sup> (Initial lubrication to the ball screw nut only)
Foundry dust	FCD400 average particle diameter: 250µm
Volume of foreign material per shaft	5g/h

[Test result]

Change in the ball after traveling 2000 km

- Type with wiper ring  
Slight flaking occurred in the ball screw shaft at travel distant of 1,000 km.
- Type with labyrinth seal  
Flaking occurred throughout the circumference of the screw shaft raceway at travel distance of 200 km.  
Flaking occurred on the balls after traveling 1,500 km.

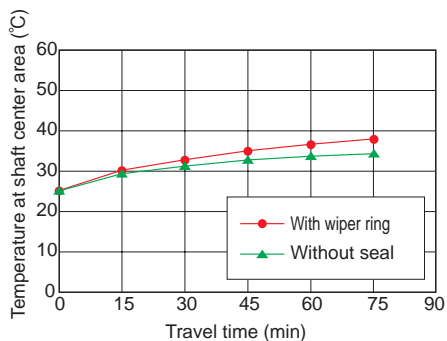

- Type with wiper ring  
Wear of balls at a travel distance of 2,000 km: 1.4 µm.
- Type with labyrinth seal  
Starts to be worn rapidly after 500 km, and the ball wear amount at the travel distance of 2,000 km: 11 µm

### ● Heat Generation Test

[Test conditions]

Item	Description
Model No.	BLK3232-3.6G0+1426LC5
Maximum rotational speed	1000min <sup>-1</sup>
Maximum speed	32m/min
Maximum circumferential speed	1.7m/s
Time constant	100ms
Stroke	1000mm
Load (through internal load)	0.98kN
Grease	THK AFG Grease 5cm <sup>3</sup> (contained in the ball screw nut)

[Test result]

Unit: °C

Item	With wiper ring	Without seal
Heat generation temperature	37.1	34.5
Temperature rise	12.2	8.9

## Specifications of the Bellows

Bellows are available as a contamination protection accessory. Use this specification sheet.

## Method for Mounting the Ball Screw Shaft

Fig.1 to Fig.4 show the representative mounting methods for the screw shaft.

The permissible axial load and the permissible rotational speed vary with mounting methods for the screw shaft. Therefore, it is necessary to select an appropriate mounting method according to the conditions.

Fig.1 Screw Shaft Mounting Method: Fixed - Free

Fig.2 Screw Shaft Mounting Method: Fixed - Supported

**Mounting Procedure and Maintenance**

**Method for Mounting the Ball Screw Shaft**

Fig.3 Screw Shaft Mounting Method: Fixed - Fixed

Fig.4 Screw Shaft Mounting Method for Rotary Nut Ball Screw: Fixed - Fixed

# Maintenance Method

## Amount of Lubricant

If the amount of the lubricant to the Ball Screw is insufficient, it may cause a lubrication breakdown, and if it is excessive, it may cause heat to be generated and the resistance to be increased. It is necessary to select an amount that meets the conditions.

### [Grease]

The feed amount of grease is generally approximately one third of the spatial volume inside the nut.

### [Oil]

Table 1 shows a guideline for the feed amount of oil.

Note, that the amount varies according to the stroke, the oil type and the conditions (e.g., suppressed heat generation).

Table1 Guideline for the Feed Amount of Oil  
(Interval: 3 minutes)

Shaft diameter (mm)	Amount of lubricant (cc)
4 to 8	0.03
10 to 14	0.05
15 to 18	0.07
20 to 25	0.1
28 to 32	0.15
36 to 40	0.25
45 to 50	0.3
55 to 63	0.4
70 to 100	0.5

## Precautions on Use

## Ball Screw

### [Handling]

- (1) Disassembling the components may cause dust to enter the system or degrade the mounting accuracy of parts. Do not disassemble the product.
- (2) Tilting the screw shaft and the ball screw nut may cause them to fall by their own weight.
- (3) Dropping or hitting the Ball Screw may damage the ball circulation section, which may cause the functional loss. Giving an impact to the product could also cause a damage to its function even if the product looks intact.

### [Lubrication]

- (1) Thoroughly remove anti-rust oil and feed lubricant before using the product.
- (2) Do not mix the lubricants of different physical properties.
- (3) In locations exposed to constant vibrations or in special environments such as clean rooms, a vacuum and a low/high temperature, normal lubricants may not be used. Contact THK for details.
- (4) When planning to use a special lubricant, contact THK before using it.
- (5) The lubrication interval varies according to the conditions. Contact THK for details.

### [Precautions on Use]

- (1) Do not remove the ball screw nut from the ball screw shaft. Doing so may cause the balls or the nut to fall off.
- (2) Entrance of foreign materials to the ball screw nut may cause damages to the ball circulating path or functional loss. Prevent foreign materials, such as dust or cutting chips, from entering the system.
- (3) If the foreign materials such as dust or cutting chips adheres to the product, replenish the lubricant after cleaning the product with pure white kerosene. For available types of detergent, contact THK.
- (4) When planning to use the product in an environment where the coolant penetrates the spline nut, it may cause problems to product functions depending on the type of the coolant. Contact THK for details.
- (5) Contact THK if you desire to use the product at a temperature of 80°C or higher.
- (6) If using the product with vertical mount, the ball screw nut may fall by its weight. Attach a mechanism to prevent it from falling.
- (7) Exceeding the permissible rotational speed may lead the components to be damaged or cause an accident. Be sure to use the product within the specification range designated by THK.
- (8) Forcefully driving in the ball screw shaft or the ball screw nut may cause an indentation on the raceway. Use care when mounting the components.
- (9) If an offset or skewing occurs with the ball screw shaft support and the ball screw nut, it may substantially shorten the service life. Pay attention to components to be mounted and to the mounting accuracy.
- (10) When using the product in locations exposed to constant vibrations or in special environments such as clean rooms, a vacuum and a low/high temperature, contact THK in advance.
- (11) Letting the ball screw nut overshoot will cause balls to fall off or the ball-circulating components to be damaged.

**[Storage]**

When storing the Ball Screw, enclose it in a package designated by THK and store it in a horizontal orientation while avoiding a high temperature, a low temperature and a high humidity.

## Features of the Lead Screw Nut

### Structure and Features

The lead Screw Nut models DCM and DC are manufactured to meet the standards for the 30° trapezoidal threads. They use a special alloy (see A-831) for the nuts and have a precision male thread, formed through die casting, as the core. As a result, these bearings achieve less unevenness in accuracy and higher accuracy and wear resistance than the machined lead screw nuts.

For the screw shafts to be used with this product, the rolled shafts are available as the standard.

In addition, the cut screw shafts and the ground screw shafts are also available according to the application. Contact THK for details.

## Features of the Special Rolled Shafts

The dedicated rolled shafts with the standardized lengths are available for the Lead Screw Nut.

### [Increased Wear Resistance]

The shaft teeth are formed by cold gear rolling, and the surface of the tooth surface is hardened to over 250 HV and are mirror-finished. As a result, the shafts are highly wear resistant and achieve significantly smooth motion when used in combination with lead screw nuts.

### [Improved Mechanical Properties]

Inside the teeth of the rolled shaft, a fiber flow occurs along the contour of the tooth surface of the shaft, making the structure around the teeth roots dense. As a result, the fatigue strength is increased.

### [Additional Machining of the Shaft End Support]

Since each shaft is rolled, additional machining of the support bearing of the shaft end can easily be performed by lathing or milling.

## High Strength Zinc Alloy

The high strength zinc alloy used in the lead screw nuts is a material that is highly resistant to seizure and the wear and has a high load carrying capacity. Its composition, the mechanical properties, the physical properties and the wear resistance are given below.

### [Composition]

Table1 Composition of the High Strength Zinc Alloy  
Unit: %

Item	Description
Al	3 to 4
Cu	3 to 4
Mg	0.03 to 0.06
Be	0.02 to 0.06
Ti	0.04 to 0.12
Zn	Remaining portion

**[Mechanical Properties]**

Item	Description
Tensile strength	275 to 314 N/mm <sup>2</sup>
Tensile yield strength (0.2%)	216 to 245 N/mm <sup>2</sup>
Compressive strength	539 to 686 N/mm <sup>2</sup>
Compressive yield strength (0.2%)	294 to 343 N/mm <sup>2</sup>
Fatigue strength	132 N/mm <sup>2</sup> × 10 <sup>7</sup> (Schenk bending test)
Charpy impact	0.098 to 0.49 N-m/mm <sup>2</sup>
Elongation	1 to 5 %
Hardness	120 to 145 HV

**[Physical Properties]**

Item	Description
Specific gravity	6.8
Specific heat	460 J/ (kg·K)
Melting point	390 °C
Thermal expansion coefficient	24 × 10 <sup>-6</sup>

**[Wear Resistance]**

Item	Description
Test piece rotational speed	185 min <sup>-1</sup>
Load	392 N
Lubricant	Dynamo oil

## Selecting a Lead Screw Nut

### [Dynamic Permissible Torque T and Dynamic Permissible Thrust F]

The dynamic permissible torque (T) and the dynamic permissible thrust (F) are the torque and the thrust at which the contact surface pressure on the tooth surface of the bearing is 9.8 N/mm<sup>2</sup>. These values are used as a measuring stick for the strength of the lead screw nut.

### [pV Value]

With a sliding bearing, a pV value, which is the product of the contact surface pressure (p) and the sliding speed (V), is used as a measuring stick to judge whether the assumed model can be used. Use the corresponding pV value indicated in Fig.1 as a guide for selecting a lead screw nut. The pV value varies also according to the lubrication conditions.

Fig.1 pV Value

### ● fs: Safety Factor

To calculate a load applied to the lead screw nut, it is necessary to accurately obtain the effect of the inertia that changes with the weight and dynamic speed of an object. In general, with the reciprocating or the rotating machines, it is not easy to accurately obtain all the factors such as the effect of the start and stop, which are always repeated. Therefore, if the actual load cannot be obtained, it is necessary to select a bearing while taking into account the empirically obtained safety factors (fs) shown in Table1.

Table1 Safety Factor (fs)

Type of load	Lower limit of fs
For a static load less frequently used	1 to 2
For an ordinary single-directional load	2 to 3
For a load accompanied by vibrations/impact	4 or greater

● **f<sub>T</sub>: Temperature Factor**

If the temperature of the lead screw nut exceeds the normal temperature range, the seizure resistance of the nut and the strength of the material will decrease. Therefore, it is necessary to multiply the dynamic permissible torque (T) and the dynamic permissible thrust (F) by the corresponding temperature factor indicated in Fig.2.

Accordingly, when selecting a lead screw nut, the following equations need to be met in terms of its strength.

Dynamic permissible torque(T)

$$f_s \leq \frac{f_T \cdot T}{P_T}$$

Static permissible thrust(F)

$$f_s \leq \frac{f_T \cdot F}{P_F}$$

- f<sub>s</sub> : Safety factor (see A-833Table1)
- f<sub>T</sub> : Temperature factor (see Fig.2)
- T : Dynamic permissible torque (N-m)
- P<sub>T</sub> : Applied torque (N-m)
- F : Dynamic permissible thrust (N)
- P<sub>F</sub> : Axial load (N)

● **Hardness of the Surface and the Wear Resistance**

The hardness of the shaft significantly affects the wear resistance of the lead screw nut. If the hardness is equal to or less than 250 HV, the abrasion loss increases as indicated in Fig.3. The roughness of the surface should preferably be 0.80a or less.

A special rolled shaft achieves the surface hardness of 250 HV or greater, through hardening as a result of rolling, and surface roughness of 0.20a or less. Therefore, the dedicated rolled shaft is highly wear resistant.

Fig.2 Temperature Factor

Fig.3 Hardness of the Surface and Wear Resistance

### [Calculating the Contact Surface Pressure p]

The value of "p" is obtained as followed.

$$p = \frac{P_F}{F} \times 9.8$$

p : Contact surface pressure on the tooth from an axial load ( $P_F$  N) (N/mm<sup>2</sup>)

F : Dynamic permissible thrust (N)

$P_F$  : Axial load (N)

### [Calculating the Sliding Speed V on the Teeth]

The value of "V" is obtained as followed.

$$V = \frac{\pi \cdot Do \cdot n}{\cos \alpha \times 10^3}$$

V : Sliding speed (m/min)

Do : Effective diameter (mm)  
(see specification table)

n : Rotation speed per minute (min<sup>-1</sup>)

$\alpha$  : Lead angle (degree)  
(see specification table)

R : Lead (mm)

### [Example of Calculation]

Assuming that Lead Screw Nut model DCM is used, select a lead screw nut that travels at feed speed  $S = 3$  m/min while receiving an axial load  $P_F = 1,080$  N, which is applied in one direction. First, tentatively select model DCM32 (dynamic permissible thrust  $F = 21,100$  N). Obtain the contact surface pressure (p).

$$p = \frac{P_F}{F} \times 9.8 = \frac{1080}{21100} \times 9.8 \doteq 0.50 \text{ N/mm}^2$$

Obtain the sliding speed (V).

The rotation speed per minute (n) of the screw shaft needed to move it at feed speed  $S = 3$  m/min is calculated as follows.

$$n = \frac{S}{l \times 10^{-3}} = \frac{3}{6 \times 10^{-3}} = 500 \text{ min}^{-1}$$

$$V = \frac{\pi \cdot Do \cdot 500}{\cos \alpha \times 10^3} = \frac{\pi \times 29 \times 500}{\cos 3^\circ 46' \times 10^3} \doteq 45.6 \text{ m/min}$$

From the diagram of pV values (see Fig.1 on A-833), it is judged that there will be no abnormal wear if the sliding speed (V) is 47 m/min or below against the "p" value of 0.50 N/mm<sup>2</sup>. Second, obtain the safety factor ( $f_s$ ) against the dynamic permissible thrust (F). Given the conditions: temperature factor  $f_T = 1$  and applied load  $P_F = 1,080$  N, the safety factor is calculated as follows.

$$f_s \leq \frac{f_T \cdot F}{P_F} = \frac{1 \times 21100}{1080} = 19.5$$

Since the required strength will be met if " $f_s$ " is at least 2 because of the type of load, it is appropriate to select model DCM32.

## Efficiency and Thrust

The efficiency ( $\eta$ ) at which the screw transfers a torque into thrust is obtained from the following equation.

$$\eta = \frac{1 - \mu \tan \alpha}{1 + \mu / \tan \alpha}$$

$\eta$  : Efficiency

$\alpha$  : Lead angle

$\mu$  : Frictional resistance

Fig.4 shows the result of the above equation.

The thrust generated when a torque is applied is obtained from the following equation.

$$F_a = \frac{2 \cdot \pi \cdot \eta \cdot T}{R \times 10^{-3}}$$

$F_a$  : Thrust generated (N)

$T$  : Torque (input) (N-m)

$R$  : Lead (mm)

Fig.4 Efficiency

### [Example of Calculation]

Assuming that Lead Screw Nut model DCM20 is used and the input torque  $T = 19.6$  N-m, obtain the thrust to be generated.

Calculate the efficiency ( $\eta$ ) when  $\mu = 0.2$ .

The lead angle ( $\alpha$ ) of model DCM20:  $4^\circ 03'$

From the diagram in Fig.4, the efficiency ( $\eta$ ) when the friction coefficient  $\mu = 0.2$  is obtained as  $\eta = 0.257$ .

Obtain the thrust generated.

$$F_a = \frac{2 \cdot \pi \cdot \eta \cdot T}{R \times 10^{-3}} = \frac{2 \times \pi \times 0.257 \times 19.6}{4 \times 10^{-3}} \doteq 7700 \text{ N}$$

## Accuracy Standards

Table2 Accuracy of the Screw Shaft of Models DCM and DC

Unit: mm

Shaft symbol	Rolled shaft	Cut shaft	Ground shaft
Accuracy	T <sup>Note</sup>	K <sup>Note</sup>	G <sup>Note</sup>
Single pitch error (max)	±0.020	±0.015	±0.005
Accumulated pitch error (max)	±0.15/300	±0.05/300	±0.015/300

Note) Symbols T, K and G indicate machining methods for the screw shaft. The cut shafts and ground shafts are build-to-order.

## Point of Design

## Lead Screw Nut

### Fit

For the fitting between the lead screw nut circumference and the housing, we recommend a loose fitting or a tight fitting.

Housing inner-diameter tolerance: H8 or J8

# Mounting Procedure and Maintenance Lead Screw Nut

## Installation

### [About Chamfer of the Housing's Mouth]

To increase the strength of the root of the flange of the lead screw nut, the corner is machined to have an R shape. Therefore, it is necessary to chamfer the inner edge of the housing's mouth.

Fig.1

### [Recommended Mounting Orientation]

When vertically conveying a heavy object using the screw shaft, it is safe to mount the screw as shown in Fig.2 where supports are provided on the mounting holes to prevent the moving object from falling even if the lead screw nut is broken due to an overload or an impact.

### [Example of Installation]

Fig.3 shows examples of mounting the lead screw nuts. When mounting a lead screw nut, secure sufficient tightening strength in the axial direction. For the housing inner-diameter tolerance, see the section concerning fitting on A-838.

Fig.3 Examples of Installing the Lead Screw Nut

## Lubrication

Select a lubrication method according to the conditions of the lead screw nut.

### [Oil Lubrication]

For a lubrication of the lead screw nut, an oil lubrication is recommended. Specifically, an oil-bath lubrication or drop the lubrication is particularly effective. An oil-bath lubrication is the most appropriate method since it meets harsh conditions such as high speed, a heavy load or an external heat transmission and it cools the lead screw nut. The drop lubrication is appropriate for low to medium speed and a light to medium load. Select a lubricant according to the conditions as indicated in Table2.

Table2 Selection of a Lubricant

Condition	Types of Lubricants
Low speed, high load, high temperature	High-viscosity sliding surface oil or turbine oil
High speed, light load, low temperature	Low-viscosity sliding surface oil or turbine oil

### [Grease Lubrication]

In the low-speed feed, which occurs less frequently, the user can lubricate the slide system by manually applying grease to the shaft on a regular basis or using the greasing hole on the lead screw nut. We recommend using lithium-soap group grease No. 2.

## Features of the Change Nut

### Structure and Features

The Change Nut models DCMA and DCMB have a lead angle of  $45^\circ$ , which is difficult to achieve through machining. Each model is capable of converting a straight motion to a rotary motion, or a vice versa, at 70% efficiency. Because of the large leads, they are optimal for providing a fast feed mechanism at a low-speed rotation. The multi-thread screw shafts to be combined with these change nuts are formed through cold gear rolling. The surface of the teeth is hardened to over 250 HV and mirror-finished. As a result, the shafts are highly wear resistant and achieve significantly smooth motion when used in combination with these change nuts. Models DCMA40, DCMB40 or higher are designed for use in combination with the cut screw shafts.

The Miniature Change Nuts are made of an oil-impregnated plastic, and have a wear resistance and excel in lubrication especially in an oil-less operation. In addition, since the high level of their performances can be maintained for a long period, they allow long-term maintenance-free operation.

## Features of the Special Rolled Shafts

Dedicated rolled shafts with the standardized lengths are available for the Change Nut.

### [Increased Wear Resistance]

The shaft teeth are formed by cold gear rolling, and the tooth surface is hardened to over 250 HV and mirror-finished. As a result, the shafts are highly wear resistant and achieve significantly smooth motion when used in combination with the nuts.

### [Improved Mechanical Properties]

Inside the teeth of the rolled shaft, a fiber flow occurs along the contour of the tooth surface of the shaft, making the structure around the teeth roots dense. As a result, the fatigue strength is increased.

### [Additional Machining of the Shaft End Support]

Since each shaft is rolled, additional machining of the support bearing of the shaft end can easily be performed by lathing or milling.

## High Strength Zinc Alloy

The high strength zinc alloy used in the change nuts is a material that is highly resistant to seizure and the wear and has a high load carrying capacity. Its composition, the mechanical properties, the physical properties and the wear resistance are given below.

### [Composition]

Table1 Composition of the High Strength Zinc Alloy  
Unit: %

Item	Description
Al	3 to 4
Cu	3 to 4
Mg	0.03 to 0.06
Be	0.02 to 0.06
Ti	0.04 to 0.12
Zn	Remaining portion

Lubricant	Dynamo oil

## Selecting a Change Nut

### [Dynamic Permissible Torque T and Dynamic Permissible Thrust F]

The dynamic permissible torque (T) and the dynamic permissible thrust (F) are the torque and the thrust at which the contact surface pressure on the tooth surface of the bearing is 9.8 N/mm<sup>2</sup>. These values are used as a measuring stick for the strength of the change nut.

### [pV Value]

With a sliding bearing, a pV value, which is the product of the contact surface pressure (p) and the sliding speed (V), is used as a measuring stick to judge whether the assumed model can be used. Use the corresponding pV value indicated in Fig.1 as a guide for selecting a change nut. The pV value varies also according to the lubrication conditions.

Fig.1 pV Value

Table1 Safety Factor ( $f_s$ )

Type of load	Lower limit of $f_s$
For a static load less frequently used	1 to 2
For an ordinary single-directional load	2 to 3
For a load accompanied by vibrations/impact	4 or greater

### ● $f_s$ : Safety Factor

To calculate a load applied to the change nut, it is necessary to accurately obtain the effect of the inertia that changes with the weight and the dynamic speed of an object. In general, with the reciprocating or the rotating machines, it is not easy to accurately obtain all the factors such as the effect of the start and stop, which are always repeated. Therefore, if the actual load cannot be obtained, it is necessary to select a bearing while taking into account the empirically obtained safety factors ( $f_s$ ) shown in Table1.

● **f<sub>r</sub>: Temperature Factor**

If the temperature of the change nut exceeds the normal temperature range, the seizure resistance of the nut and the strength of the material will decrease. Therefore, it is necessary to multiply the dynamic permissible torque (T) and the dynamic permissible thrust (F) by the corresponding temperature factor indicated in Fig.2.

Note) In the case of a miniature Change Nut, be sure to use it at 60°C or below.

Accordingly, when selecting a change nut, the following equations need to be met in terms of its strength.

Dynamic permissible torque(T)

$$f_s \leq \frac{f_r \cdot T}{P_T}$$

Static permissible thrust(F)

$$f_s \leq \frac{f_r \cdot F}{P_F}$$

f<sub>s</sub> : Static safety factor

(see Table1 on A-845)

f<sub>r</sub> : Temperature factor (see Fig.2)

T : Dynamic permissible torque (N-m)

P<sub>T</sub> : Applied torque (N-m)

F : Dynamic permissible thrust (N)

P<sub>F</sub> : Axial load (N)

● **Hardness of the Surface and Wear Resistance**

The hardness of the shaft significantly affects the wear resistance of the change nut. If the hardness is equal to or less than 250 HV, the abrasion loss increases as indicated in Fig.3. The roughness of the surface should preferably be 0.80a or less.

A special rolled shaft achieves surface hardness of 250 HV or greater, through hardening as a result of rolling, and surface roughness of 0.20a or less. Thus, the dedicated rolled shaft is highly wear resistant.

Fig.2 Temperature Factor

Fig.3 Hardness of the Surface and Wear Resistance

**[Calculating the Contact Surface Pressure p]**

The value of "p" is obtained as followed.

● **If an axial load is applied:**

$$p = \frac{P_F}{F} \times 9.8$$

p : Contact surface pressure on the tooth from an axial load ( $P_F$  N) (N/mm<sup>2</sup>)

F : Dynamic permissible thrust (N)

$P_F$  : Axial load (N)

● **If a torque is applied:**

$$p = \frac{P_T}{T} \times 9.8$$

p : Contact surface pressure on the tooth under a load torque ( $P_T$  N-m) (N/mm<sup>2</sup>)

T : Dynamic permissible torque (N-m)

$P_T$  : Applied torque (N-m)

**[Calculating the Sliding Speed V on the Teeth]**

The value of "V" is obtained as followed.

$$V = \frac{\sqrt{2 \cdot \pi \cdot D_o \cdot n}}{10^3}$$

V : Sliding speed (m/min)

$D_o$  : Effective diameter  
(see specification table) (mm)

n : Rotation speed per minute (min<sup>-1</sup>)

R : Lead (mm)

### [Example of Calculation]

Assuming that Change Nut model DCMB is used, select a screw nut that travels at feed speed  $S = 10$  m/min while receiving an axial load  $P_F = 1,760$  N accompanied by vibrations.

Obtain the  $pV$  value.

First, tentatively select model DCMB25T (dynamic permissible thrust  $F = 12,700$  N).

Obtain the contact surface pressure ( $p$ ).

$$p = \frac{P_F}{F} \times 9.8 = \frac{1760}{12700} \times 9.8 \doteq 1.36 \text{ N/mm}^2$$

Obtain the sliding speed ( $V$ ). The revolutions per minute ( $n$ ) of the screw shaft needed to move it at feed speed  $S = 10$  m/min is calculated as follows.

$$n = \frac{S}{R \times 10^{-3}} = \frac{3}{73.3 \times 10^{-3}} \doteq 136 \text{ min}^{-1}$$

$$V = \frac{\sqrt{2} \cdot \pi \cdot D_o \cdot n}{10^3} = \frac{\sqrt{2} \times \pi \times 23.1 \times 136}{10^3} \doteq 14.0 \text{ m/min}$$

From the diagram of  $pV$  values (see Fig.1 on A-845), it is judged that there will be no abnormal wear if the sliding speed ( $V$ ) is 16m/min or below against the " $p$ " value of 1.36 N/mm<sup>2</sup>.

Second, obtain the safety factor ( $f_s$ ) against the dynamic permissible thrust ( $F$ ).

Given the conditions:

Temperature factor  $f_T = 1$ , and

Applied load  $P_F = 1,760$  N, the safety factor is calculated as follows.

$$f_s \leq \frac{f_T \cdot F}{P_F} = \frac{1 \times 12700}{1760} = 7.2$$

Since the required strength will be met if " $f_s$ " is at least 4 because of the type of load, it is appropriate to select model DCMB25T.

## Efficiency, Thrust and Torque

The efficiency ( $\eta$ ) of the change nut in relation to the friction coefficient ( $\mu$ ) is indicated in Table2.

Table2 Friction Coefficient and Efficiency

Frictional coefficient ( $\mu$ )	0.1	0.15	0.2
Efficiency ( $\eta$ )	0.82	0.74	0.67

The thrust generated when a torque is applied is obtained from the following equation.

$$F_a = 2 \cdot \pi \cdot \eta \cdot T/R \times 10^{-3}$$

$F_a$	: Thrust generated	(N)
$T$	: Torque (input)	(N-m)
$R$	: Lead	(mm)

Also, the torque generated when a thrust is applied is obtained from the following equation.

$$T = \eta \cdot F_a \cdot R \times 10^{-3}/2\pi$$

$T$	: Torque generated	(N-m)
$F_a$	: Thrust (input)	(N)
$R$	: Lead	(mm)

### [Example of Calculation - 1]

Assuming that Change Nut model DCMB20T is used and the torque  $T$  is equal to 19.6 N-m, obtain the thrust to be generated.

If " $\mu$ " is 0.2, the efficiency " $\eta$ " is 0.67 (see Table2), and the generated thrust ( $F_a$ ) is calculated as follows.

$$F_a = 2 \cdot \pi \cdot \eta \cdot T/R \times 10^{-3} = \frac{2 \times \pi \times 0.67 \times 19.6}{60 \times 10^{-3}} \doteq 1370 \text{ N}$$

### [Example of Calculation - 2]

Assuming that Change Nut model DCMB20T is used and the thrust  $F_a$  is equal to 980 N, obtain the torque to be generated.

If " $\mu$ " is 0.2, the efficiency " $\eta$ " is 0.67 (see Table2), and the generated torque ( $T$ ) is calculated as follows.

$$T = \frac{\eta \cdot F_a \cdot R \times 10^{-3}}{2\pi} = \frac{0.67 \times 980 \times 60 \times 10^{-3}}{2\pi} = 6.27 \text{ N} \cdot \text{m}$$

## Accuracy Standards

Table3 Accuracy of the Screw Shaft of Models DCMA and DCMB

Unit: mm

Shaft symbol	Rolled shaft
Accuracy	T <sup>Note</sup>
Single pitch error (max)	±0.025
Accumulated pitch error (max)	±0.2/300

Note) Symbol T indicates the machining method for the screw shaft.

## Fit

For the fitting between the change nut circumference and the housing, we recommend a loose fitting or a tight fitting.

Housing inner-diameter tolerance: H8 or J8

# Installation

## [About Chamfer of the Housing's Mouth]

To increase the strength of the root of the flange of the change nut, the corner is machined to have an R shape. Therefore, it is necessary to chamfer the inner edge of the housing's mouth.

Fig.1

## [Recommended Mounting Orientation]

When vertically conveying a heavy object using the screw shaft, it is safe to mount the screw as shown in Fig.2 where supports are provided on the mounting holes to prevent the moving object from falling even if the change nut is broken due to an overload or an impact.

Fig.2 Recommended Mounting Orientation

## Lubrication

Select a lubrication method according to the conditions of the change nut.

### [Oil Lubrication]

For the lubrication of the change nut, an oil lubrication is recommended. Specifically, an oil-bath lubrication or a drop lubrication is particularly effective. An oil-bath lubrication is the most appropriate method since it meets the harsh conditions such as a high speed, a heavy load or an external heat transmission and it cools the change nut. The drop lubrication is appropriate for the low to medium speed and a light to medium load. Select a lubricant according to the conditions as indicated in Table2.

Table2 Selection of a Lubricant

Conditions	Types of Lubricants
Low speed, high load, high temperature	High-viscosity sliding surface oil or turbine oil
High speed, light load, low temperature	Low-viscosity sliding surface oil or turbine oil

### [Grease Lubrication]

In a low-speed feed, which occurs less frequently, the user can lubricate the slide system by manually applying the grease to the shaft on a regular basis or using the greasing hole on the change nut. We recommend using the lithium-soap group grease No. 2.

### [Initial Lubrication of the Miniature Change Nut]

Since the Miniature Change Nut is made of oil-impregnated plastics, it can be used without the lubrication during an operation. For the initial lubrication, use some oil or grease. Note that lubricants containing large amount of extreme pressure agent are not suitable.

## Features and Types

## Cross-Roller Ring

### Features of the Cross-Roller Ring

Fig.1 Structure of Cross Roller-Ring Model RB

### Structure and Features

With the Cross-Roller Ring, cylindrical rollers are arranged with each roller perpendicular to the adjacent roller, in a 90° V groove, separated from each other by a spacer retainer. This design allows just one bearing to receive loads in all directions including radial, axial and moment loads.

Since the Cross-Roller Ring achieves high rigidity despite the minimum possible dimensions of the inner and outer rings, it is optimal for applications such as joints and swiveling units of industrial robots, swiveling tables of machining centers, rotary units of manipulators, precision rotary tables, medical equipment, measuring instruments and IC manufacturing machines.

#### [High Rotation Accuracy]

The spacer retainer fitting among cross-arrayed rollers prevents rollers from skewing and the rotational torque from increasing due to friction between rollers. Unlike conventional types using steel sheet retainers, the Cross-Roller Ring does not cause unilateral contact of roller or seize. Thus, even under a preload, the Cross-Roller Ring provides stable rotation.

Since the inner and outer rings are designed to be separable, the bearing clearance can be adjusted. In addition, a preload can be applied. These features enable accurate rotation.

## Features and Types

### Features of the Cross-Roller Ring

#### [Easy Handling]

The inner and outer rings, which are separable, are secured to the Cross-Roller Ring body after being installed with rollers and spacer retainers in order to prevent the rings from separating from each other. Thus, it is easy to handle the rings when installing the Cross-Roller Ring.

#### [Skewing Prevention]

The spacer retainer keeps rollers in their proper position, thereby preventing them from skewing (tilted rollers). This eliminates friction between rollers, and therefore secures a stable rotational torque.

#### [Increased Rigidity (Three to Four Times Greater than the Conventional Type)]

Unlike the thin angular ball bearings installed in double rows, the cross array of rollers allows a single Cross-Roller Ring unit to receive loads in all directions, increasing the rigidity to three to four times greater than the conventional type.

### [Large Load Capacity]

- (1) Compared with conventional steel sheet retainers, the spacer retainer allows a longer effective contact length of each roller, thus significantly increasing the load capacity. The spacer retainer guides rollers by supporting them over the entire length of each roller, whereas the conventional type of retainer supports them only at a point at the center of each roller. Such one-point contact cannot sufficiently prevent skewing.

- (2) In conventional types, the loaded areas are asymmetrical between the outer ring and the inner ring sides around the roller longitudinal axis. The greater the applied load is, the greater the moment becomes, leading end-face contact to occur. This causes frictional resistance, which hinders smooth rotation and quickens wear.

# Types of the Cross-Roller Ring

## Types and Features

### Model RU (Integrated Inner/Outer Ring Type)

Specification Table⇒B-796

Since holes are drilled for mounting, the need for a presser flange and a housing is eliminated. Also, owing to the integrated inner/outer ring type structure with washer, there is almost no effect from installation on performance, allowing stable rotational accuracy and torque to be obtained.

Can be used for both outer and inner ring rotation.

Model RU

### Model RB (Separable Outer Ring Type for Inner Ring Rotation)

Specification Table⇒B-798

Cross-Roller Ring basic type, with a separable outer ring, and an inner ring integrated with the main body. It is used in locations where the rotational accuracy of the inner ring is required.

It is used, for example, in the swivel portions of index tables of machine tools.

Model RB

### Model RE (Two-piece Inner Ring Type for Outer Ring Rotation)

Specification Table⇒B-801

Main dimensions are the same as model RB.

This model is used in locations where the rotational accuracy of the outer ring is required.

Model RE

## USP-Grade Series of Models RB and RE

Specification Table⇒B-804

The rotation accuracy of the USP-Grade Series achieves the ultra precision grade that surpasses the world's highest accuracy standards such as JIS Class 2, ISO Class 2, DIN P2 and AFBMA ABCE9.

## Model RA (Separable Outer Ring Type for Inner Ring Rotation)

Specification Table⇒B-805

A compact type similar to model RB with the thinnest possible inner and outer rings. Optimal for locations requiring a light-weight and compact design such as the swivel portions of robots and manipulators.

Model RA

## Model RA-C (Single-Split Type)

Specification Table⇒B-806

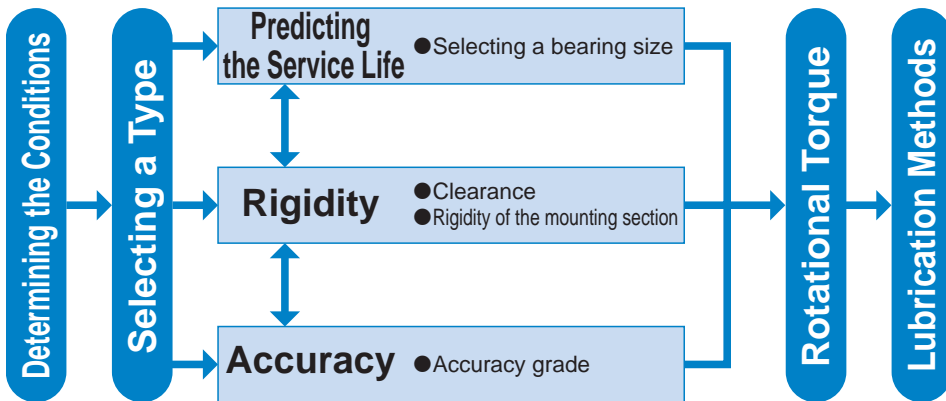

The main dimensions are the same as that of model RA. Owing to its Single-split Outer Ring structure with a highly rigid outer ring, this model can be used for outer ring rotation.

Model RA-C

## Selecting a Cross-Roller Ring

The following diagram shows a typical procedure for selecting a Cross-Roller Ring.

- Inner ring rotating.....Model RB
- Outer ring rotating.....Model RE
- Mounting space...Models RA-C and RA

## Nominal Life

The service life of the Cross-Roller Ring is obtained from the following equation.

$$L = \left( \frac{f_r \cdot C}{f_w \cdot P_c} \right)^{\frac{10}{3}} \times 10^6$$

L : Nominal life

(The total number of revolutions that 90% of a group of identical Cross-Roller Ring units independently operating under the same conditions can achieve without showing flaking from rolling fatigue)

C : Basic dynamic load rating (N)

P<sub>c</sub> : Dynamic equivalent radial load (N)

f<sub>r</sub> : Temperature factor (see Fig.1)

f<sub>w</sub> : Load factor (see Table1)

\* The basic dynamic load rating (C) of the Cross-Roller Ring shows the radial load with interlocked direction and magnitude, under which the nominal life (L) is 1 million revolutions when a group of identical Cross-Roller Ring units independently operate under the same conditions. The basic dynamic load rating (C) is indicated in the specification tables.

### [Dynamic Equivalent Radial Load P<sub>c</sub>]

The dynamic equivalent radial load of the Cross-Roller Ring is obtained from the following equation.

$$P_c = X \cdot \left( F_r + \frac{2M}{dp} \right) + Y \cdot F_a$$

P<sub>c</sub> : Dynamic equivalent radial load (N)

F<sub>r</sub> : Radial load (N)

F<sub>a</sub> : Axial load (N)

M : Moment (N-mm)

X : Dynamic radial factor (see Table2)

Y : Dynamic axial factor (see Table2)

dp : Roller pitch circle diameter (mm)

Fig.1 Temperature Factor (f<sub>r</sub>)

Note) The normal service temperature is 80 °C or below. If the product is to be used at a higher temperature, contact THK.

Table1 Load Factor (f<sub>w</sub>)

Service condition	f <sub>w</sub>
Smooth motion without impact	1 to 1.2
Normal motion	1.2 to 1.5
Motion with severe impact	1.5 to 3

Fig.2

Table2 Dynamic Radial Factor and Dynamic Axial Factor

Classification	X	Y
$\frac{F_a}{F_r + 2M/dp} \leq 1.5$	1	0.45
$\frac{F_a}{F_r + 2M/dp} > 1.5$	0.67	0.67

- If F<sub>r</sub> = 0N and M = 0 N-mm, perform calculation while assuming that X = 0.67 and Y = 0.67.
- For service life calculation with a preload taken into account, contact THK.

## [Example of Calculating the Nominal Life]

Assuming that model RB25025 is used under the following conditions, calculate its nominal life (L).

- $m_1 = 100$  kg
- $m_2 = 200$  kg
- $m_3 = 300$  kg
- $D_1 = 300$  mm
- $D_2 = 150$  mm
- $H = 200$  mm
- $C = 69.3$  kN
- $C_0 = 150$  kN
- $dp = 277.5$  mm
- $F = 100$  N
- $\omega = 2$  rad/s ( $\omega$ : angular velocity)

Fig.3

$$\begin{aligned} \text{Radial load} \quad : F_r &= F + m_1 \cdot D_1 \times 10^{-3} \cdot \omega^2 + m_2 \cdot D_2 \times 10^{-3} \cdot \omega^2 \\ &= 100 + 100 \cdot 300 \times 10^{-3} \cdot 2^2 + 200 \cdot 150 \times 10^{-3} \cdot 2^2 \\ &= 340 \text{ N} \end{aligned}$$

$$\begin{aligned} \text{Axial load} \quad : F_a &= (m_1 + m_2 + m_3) \times g \\ &= (100 + 200 + 300) \times 9.807 \\ &= 5884.2 \text{ N} \end{aligned}$$

$$\begin{aligned} \text{Moment} \quad : M &= m_1 \cdot g \times D_1 + m_2 \cdot g \times D_2 + (m_1 \cdot D_1 \times 10^{-3} \cdot \omega^2 + m_2 \cdot D_2 \times 10^{-3} \cdot \omega^2) \times H \\ &= 100 \cdot 9.807 \times 300 + 200 \cdot 9.807 \times 150 + \\ &\quad (100 \cdot 300 \times 10^{-3} \cdot 2^2 + 200 \cdot 150 \times 10^{-3} \cdot 2^2) \times 200 \\ &= 636420 \text{ N} \cdot \text{mm} \end{aligned}$$

$$\frac{F_a}{F_r + 2M/dp} = \frac{5884.2}{340 + 2 \times 636420/277.5} = 1.19 \leq 1.5$$

$$\therefore X = 1, Y = 0.45$$

Therefore, the dynamic equivalent radial load ( $P_c$ ) is obtained as follows.

$$P_c = X \left( F_r + \frac{2M}{dp} \right) + Y \cdot F_a = 1 \times \left( 340 + \frac{2 \cdot 636420}{277.5} \right) + 0.45 \times 5884.2 = 7574.7 \text{ N}$$

If  $f_w = 1.2$ , the nominal life is calculated as follows. Thus, the nominal life (L) is  $8.7 \times 10^8$  revolutions.

$$L = \left( \frac{f_r \cdot C}{f_w \cdot P_c} \right)^{\frac{10}{3}} = \left( \frac{1 \times 69.3 \times 10^3}{1.2 \times 7574.7} \right)^{\frac{10}{3}} \times 10^6 = 8.7 \times 10^8 \text{ Rotation}$$

## Static Safety Factor

The basic static load rating  $C_0$  refers to the static load with constant direction and magnitude, under which the calculated contact stress in the center of the contact area between the roller and the raceway under the maximum load is 4000 MPa. (If the contact stress exceeds this level, it will affect the rotation.) This value is indicated as "C<sub>0</sub>" in the specification tables. When a load is statically or dynamically applied, it is necessary to consider the static safety factor as shown below.

$$\frac{C_0}{P_0} = f_s$$

$f_s$  : Static safety factor (see Table3)

$C_0$  : Basic static load rating (N)

$P_0$  : Static equivalent radial load (N)

Table3 Static Safety Factor ( $f_s$ )

Load conditions	Lower limit of $f_s$
Normal load	1 to 2
Impact load	2 to 3

### [Static Equivalent Radial Load $P_0$ ]

The static equivalent radial load of the Cross-Roller Ring is obtained from the following equation.

$$P_0 = X_0 \cdot \left( F_r + \frac{2M}{dp} \right) + Y_0 \cdot F_a$$

$P_0$  : Static equivalent radial load (N)

$F_r$  : Radial load (N)

$F_a$  : Axial load (N)

$M$  : Moment (N-mm)

$X_0$  : Static radial factor ( $X_0=1$ )

$Y_0$  : Static axial factor ( $Y_0=0.44$ )

$dp$  : Roller pitch circle diameter (mm)

Fig.4

**[Example of Calculating a Static Safety Factor]**

Assuming that model RB25025 is used under the following conditions, calculate its static safety factor ( $f_s$ ).

- $m_1 = 100 \text{ kg}$
- $m_2 = 200 \text{ kg}$
- $m_3 = 300 \text{ kg}$
- $D_1 = 300 \text{ mm}$
- $D_2 = 150 \text{ mm}$
- $H = 200 \text{ mm}$
- $C = 69.3 \text{ kN}$
- $C_0 = 150 \text{ kN}$
- $dp = 277.5 \text{ mm}$
- $F = 100 \text{ N}$
- $\omega = 2 \text{ rad/s}$  ( $\omega$ : angular velocity)

Fig.5

$$\begin{aligned} \text{Radial load} \quad : F_r &= F + m_1 \cdot D_1 \times 10^{-3} \cdot \omega^2 + m_2 \cdot D_2 \times 10^{-3} \cdot \omega^2 \\ &= 100 + 100 \cdot 300 \times 10^{-3} \cdot 2^2 + 200 \cdot 150 \times 10^{-3} \cdot 2^2 \\ &= 340 \text{ N} \end{aligned}$$

$$\begin{aligned} \text{Axial load} \quad : F_a &= (m_1 + m_2 + m_3) \times g \\ &= (100 + 200 + 300) \times 9.807 \\ &= 5884.2 \text{ N} \end{aligned}$$

$$\begin{aligned} \text{Moment} \quad : M &= m_1 \cdot g \times D_1 + m_2 \cdot g \times D_2 + (m_1 \cdot D_1 \times 10^{-3} \cdot \omega^2 + m_2 \cdot D_2 \times 10^{-3} \cdot \omega^2) \times H \\ &= 100 \cdot 9.807 \times 300 + 200 \cdot 9.807 \times 150 + \\ &\quad (100 \cdot 300 \times 10^{-3} \cdot 2^2 + 200 \cdot 150 \times 10^{-3} \cdot 2^2) \times 200 \\ &= 636420 \text{ N} \cdot \text{mm} \end{aligned}$$

Therefore, the static equivalent radial load ( $P_0$ ) is obtained as follows.

$$P_0 = X \left( F_r + \frac{2M}{dp} \right) + Y \cdot F_a = 1 \times \left( 340 + \frac{2 \cdot 636420}{277.5} \right) + 0.44 \times 5884.2 = 7515.8 \text{ N}$$

$$\therefore f_s = \frac{150 \times 10^3}{7515.8} = 20$$

Thus, the static safety factor ( $f_s$ ) is 20.

## Static Permissible Moment

The static permissible moment ( $M_0$ ) of the Cross-Roller Ring is obtained from the following equation.

$$M_0 = C_0 \cdot \frac{dp}{2} \times 10^{-3}$$

$M_0$  : Static permissible moment (kN·m)

$C_0$  : Basic static load rating (kN)

$dp$  : Roller pitch circle diameter (mm)

### [Example of Calculating a Static Permissible Moment]

Model No. RB25025

$C = 69.3$  kN

$C_0 = 150$  kN

$dp = 277.5$  mm

The static permissible moment is calculated as follows.

$$M_0 = C_0 \cdot \frac{dp}{2} \times 10^{-3} = 150 \cdot \frac{277.5}{2} \times 10^{-3} = 20.8 \text{ kN} \cdot \text{m}$$

## Static Permissible Axial Load

The static permissible axial load ( $F_{a0}$ ) of the Cross-Roller Ring is obtained from the following equation.

$$F_{a0} = \frac{C_0}{Y_0}$$

$F_{a0}$  : Static permissible axial load (kN)

$Y_0$  : Static axial factor ( $Y_0=0.44$ )

### [Example of Calculating a Static Permissible Axial Load]

Model No. RB25025

$C = 69.3$  kN

$C_0 = 150$  kN

The static permissible axial load ( $F_{a0}$ ) is calculated as follows.

$$F_{a0} = \frac{C_0}{Y_0} = \frac{150}{0.44} = 340.9 \text{ kN}$$

## Accuracy Standards

The Cross-Roller Ring is manufactured with the accuracy and the dimensional tolerance according to Table4 to Table13.

Table4 Rotational Accuracy of the Inner Ring of Model RU

Unit:  $\mu\text{m}$ 

Model No.	Radial runout tolerance of the inner ring			Axial runout tolerance of the inner ring

630	800	0	-150	0	-200
800	1000	0	-300	0	-400
1000	1250	0	-300	0	-400

Note) All B and B1 types of models RA and RA-C are manufactured with tolerance between -0.120 and 0.

## Accuracy Standard of the USP-Grade Series

### Examples of Rotational Accuracy of the USP-Grade Series Cross-Roller Rings

The rotation accuracy of the USP-Grade Series achieves the ultra precision grade that surpasses the world's highest accuracy standards such as JIS Class 2, ISO Class 2, DIN P2 and AFBMA ABEC9.

### Accuracy Standards

The USP-grade series of models RB and RE are manufactured with runout accuracies according to Table14.

Table14 Runout Accuracies of the USP-grade Series

Unit: μm

Nominal inner diameter (d) and outer diameter (D) (mm)		Runout accuracy of the inner ring of model RB		Runout accuracy of the outer ring of model RE	
Above	Or less	Radial runout tolerance	Axial runout tolerance	Radial runout tolerance	Axial runout tolerance
80	180	2.5	2.5	3	3
180	250	3	3	4	4

# Moment Rigidity

Fig.6 to Fig.9 show moment rigidity diagrams for the Cross-Roller Ring as a separate unit. Rigidity is affected by the deformation of the housing, presser flange and bolts. Therefore, the strength of these parts must be taken into account.

(Radial clearance: 0)

## Point of Design

## Cross-Roller Ring

### Fit

#### [Fitting of Models RU]

Fitting for model RU is basically not required. However, for fitting requiring positioning accuracy, h7 and H7 are recommended.

#### [Fitting of Models RB, RE and RA]

For the fitting of models RB, RE and RA, we recommend using the combinations indicated in Table1.

Table1 Fitting of Models RB, RE and RA

Radial clearance	Service condition		Shaft	Housing
C0	Inner ring rotational load	Normal load	h5	H7
		Large impact and moment	h5	H7
	Outer ring rotational load	Normal load	g5	Js7
		Large impact and moment	g5	Js7
C1	Inner ring rotational load	Normal load	j5	H7
		Large impact and moment	k5	Js7
	Outer ring rotational load	Normal load	g6	Js7
		Large impact and moment	h5	K7

Note) For the fitting for clearance CC0, avoid interference because it will cause an excessive preload. As for the fitting when you have selected clearance CC0 for the joints or swiveling unit of a robot, the combination of g5 and H7 is recommended.

#### [Fitting of the USP-grade]

For the fitting of the USP-grade series of models RB and RE, we recommend using the combinations indicated in Table2.

Table2 Fitting of the USP-grade

Radial clearance	Condition	Shaft	Housing
CC0	Inner ring rotational load	h5	J7
	Outer ring rotational load	g5	Js7
C0	Inner ring rotational load	j5	J7
	Outer ring rotational load	g5	K7

#### [Fitting for Model RA-C]

For the fitting of model RA-C, we recommend using the combinations indicated in Table3.

Table3 Fitting for Model RA-C

Radial clearance	Condition	Shaft	Housing
CC0	Inner ring rotational load	h5	J7
	Outer ring rotational load	g5	Js7
C0	Inner ring rotational load	j5	J7
	Outer ring rotational load	g5	K7

## Designing the Housing and the Presser Flange

Since the Cross-Roller Ring is a compact, thin device, special consideration must be given to the rigidity of the housing and the presser flange.

With types having a separable outer ring, insufficiency in the strength of the housing, pressure flange or the presser bolt will result in the inability to evenly hold the inner or outer ring, or the deformation of the bearing when a moment load is applied. Consequently, the contact area of the rollers will become uneven, causing the bearing's performance to significantly deteriorate.

Fig.2 shows examples of installing the Cross-Roller Ring.

### [Housing]

When determining the thickness of the housing, make sure it is at least 60% of the sectional height of the bearing as a guide.

$$\text{Housing thickness } T = \frac{D-d}{2} \times 0.6 \text{ or greater}$$

(D: outer diameter of the outer ring;  
d: inner diameter of the inner ring)

If tapped holes for removing the inner or outer ring (Fig.1) are provided, the ring can be removed without causing damage to the bearing. When removing the outer ring, do not press the inner ring, or vice versa. For the dimensions of the presser on the side(s), see the shoulder dimensions indicated in the corresponding specification table.

Fig.1

Fig.2 Example of Installation

**Point of Design**

**Designing the Housing and the Presser Flange**

**[Presser Flange and Presser Bolt]**

When determining the thickness of the presser flange (F) or the clearance of the flange section (S), refer to the dimensions indicated below as a guide.

As for the number of the presser bolts, the greater the number of the bolts, the more stable the system becomes. As a guide, however, it is normally appropriate to use the number of bolts indicated in Table4 and equidistantly arrange them.

$F = B \times 0.5 \text{ to } B \times 1.2$

$H = B_{0.1}^0$

$S = 0.5 \text{ mm}$

Even if the shaft and the housing are made of light alloy, it is recommendable to select a steel-based material for the presser flange.

When tightening the presser bolts, firmly secure them using a torque wrench or the like so that they will not loosen. Table5 shows tightening torques for the housing and presser flanges made of typical steel materials with medium hardness.

Table4 Number of Presser Bolts and Bolt Sizes

Unit: mm

Outer diameter of the outer ring (D)		No. of bolts	Bolt size (reference value)
Above	Or less		
—	100	8 or more	M3 to M5
100	200	12 or more	M4 to M8
200	500	16 or more	M5 to M12
500	—	24 or more	M12 or thicker

Table5 Bolt Tightening Torque

Unit: N·m

Screw model No.	Tightening torque	Screw model No.	Tightening torque
M3	2	M10	70
M4	4	M12	120
M5	9	M16	200
M6	14	M20	390
M8	30	M22	530

## Mounting Procedure

## Cross-Roller Ring

### Procedure for Assembly

When assembling the Cross-Roller Ring, follow the steps below.

#### [Inspecting the Parts before Assembling Them]

Thoroughly clean the housing and other parts to be assembled, and check if there is no burr or knots.

#### [Installing the Cross-Roller Ring into the Housing or onto the Shaft]

Since the Cross-Roller Ring is a thin bearing, it tends to tilt as it is installed. To prevent it, gradually drive the Cross-Roller Ring into the housing or onto the shaft by gently hitting it with a plastic hammer while keeping it horizontal. Be sure to keep hammering it with much care until you hear it fully contact the reference surface.

#### [Attaching the Presser Flange]

- (1) Place the presser flange onto the Cross-Roller Ring. Rock the flange several times to match the bolt holes.
- (2) Insert the presser bolts into the holes. Manually turn the bolts and make sure they do not show skewing caused by misalignment of the holes.
- (3) Fasten the presser bolts in three to four steps from temporary to full fastening by repeatedly securing the bolts in the diagonal order, as shown in Fig.1. When tightening the separable inner or outer ring, slightly turning the integral outer or inner ring will correct the dislocation between the ring and the body.

Fig.1 Tightening Sequence

## Precautions on Use

## Cross-Roller Ring

### [Handling]

- (1) The separable inner or outer ring is fastened in place using special rivets, bolts or nuts when delivered. When installing it to the system, do not disassemble it. Also, erroneously installing the spacer retainer will significantly affect the rotational performance of the system. Do not disassemble the bearing.
- (2) The matching mark of the inner or outer ring may be slightly misaligned when delivered. In that case, loosen the bolts that secure the inner or outer ring, and correct the alignment using a plastic hammer or the like, before installing it to the housing. (Let the securing rivets follow the housing.)
- (3) When installing or removing the Cross-Roller Ring, do not apply force to the fixing rivets or the bolts.
- (4) When mounting the presser flange, take into account the dimensional tolerances of the parts so that the flange firmly holds the inner and outer ring from the side.
- (5) Dropping or hitting the Cross-Roller Ring may damage it. Giving an impact force to the bushing could also cause damage even if the product looks intact.

### [Lubrication]

- (1) Since each Cross-Roller Ring unit contains high-quality lithium soap group grease No. 2, you can start using the product without replenishing grease. However, the product requires regular lubrication since it has a smaller internal space than ordinary roller bearings and because the rollers need frequent lubrication due to their rolling contact structure.

To replenish grease, it is necessary to secure greasing holes that lead to the oil grooves formed on the inner and outer rings. As for the lubrication interval, normally replenish grease of the same group so that it is distributed throughout the interior of the bearing at least every six to twelve months.

When the bearing is filled up with grease, the initial rotational torque temporarily increases. However, surplus grease will run off of the seals and the torque will return to the normal level in a short period. The thin type does not have an oil groove. Secure an oil groove inside the housing for lubrication.

- (2) Do not mix greases with different physical properties.
- (3) In locations exposed to constant vibrations or in special environments such as clean rooms, vacuum and low/high temperature, normal lubricants may not be used. Contact THK for details.
- (4) When planning to use a special lubricant, contact THK before using it.

### [Precautions on Use]

- (1) Entrance of foreign material may cause damage to the ball circulating path or functional loss. Prevent foreign material, such as dust or cutting chips, from entering the system.
- (2) Contact THK if you desire to use the product at a temperature of 80°C or higher.
- (3) If planning to use the Cross-Roller Ring in an environment where a coolant penetrates into the product, contact THK.
- (4) If foreign material adheres to the product, replenish the lubricant after cleaning the product.
- (5) When using the product in locations exposed to constant vibrations or in special environments such as clean rooms, vacuum and low/high temperature, contact THK in advance.

## Features and Types

## Cam Follower

### Features of the Cam Follower

Fig.1 Structure of Cam Follower Model CF...UU-A

### Structure and Features

The Cam Follower is a compact and highly rigid bearing with a shaft. It contains needle bearings and is used as a guide roller for cam mechanisms or straight motion.

Since its outer ring rotates while keeping direct contact with the mating surface, this product is thick-walled and designed to bear an impact load.

Inside the outer ring, needle rollers and a precision cage are incorporated. This prevents the product from skewing and achieves a superb rotation performance. And, as a result, the product is capable of easily withstanding high-speed rotation.

There are two types of the outer ring in shape: spherical and cylindrical. The spherical outer ring easily absorbs a distortion of the shaft center when the cam follower is installed and helps lighten a biased load.

The Cam Follower is used in a wide range of applications such as cam mechanisms of automatic machines, dedicated machines as well as carrier systems, conveyors, bookbinding machines, tool changers of machining centers, pallet changers, automatic coating machines, and sliding forks of automatic warehouses.

## Cam Follower with a Hexagon Socket

For Cam Follower model CF, Cam Follower Containing Thrust Balls model CFN and Eccentric Cam Follower model CFH, hexagon socket studs that allow easy eccentricity adjustment are available.

If desiring a hexagon socket on the stud head, add "A" to the end of the model number. If desiring a hexagon socket on the stud thread, add "B". ("B" applies to model CF12 or higher.)

The Same Dimension of the Hexagonal Width Across Flats (H Dimension) Applies to Both Type A and Type B.

## Cam Follower Containing Thrust Balls

Even a slight mounting error in a high speed cam mechanism operating in a harsh environment could cause abnormal wear to the thrust unit of the cam follower. In such a case, using Cam Follower Containing Thrust Balls model CFN will bring about a significant effect in increasing the durability.

Models CFN5 to 12 are standard-stock items. If desiring a size other than the standard items, contact THK.

Model CFN is capable of receiving a thrust load caused by a slight mounting error. However, it is necessary to minimize a component of thrust force, or prevent it from occurring, when designing the cam mechanism and installing the Cam Follower.

Fig.2

# Types of the Cam Follower

## Types and Features

### Popular Type Cam Follower Model CF

[Specification Table⇒B-808](#)

It is a popular type of Cam Follower provided with a driver groove on the head of the stud. A highly corrosion resistant stainless steel type (symbol M) is also available.

Model CF

### Cam Follower with a Hexagon Socket Model CF-A

[Specification Table⇒B-810](#)

Since the stud head has a hexagon socket, this model can easily be installed using a hexagon wrench.

A type whose stud screw has a hexagon socket (CF-B) is also available. (applicable to stud diameter of 12 or greater)

Model CF-A

### Eccentric Cam Follower with a Hexagon Socket Model CFH-A

[Specification Table⇒B-814](#)

This model can be installed in the same mounting hole as that of model CF. Since the mounting shaft of the stud and the stud head are eccentric by 0.25 mm to 1.0 mm, the position of this model can easily be adjusted simply by turning the stud. Thus, it is a compact, highly accurate eccentric cam follower with an integral structure. As a result, the man-hours for machining and assembly can significantly be reduced because it is unnecessary to align the cam follower with the cam groove and machine the mounting-hole area with precision.

Model CFH-A

### Cam Follower Containing Thrust Balls Model CFN

[Specification Table⇒B-816](#)

Based on the popular type Cam Follower, this model is incorporated with thrust load balls.

Model CFN

**Cam Follower with a Tapped Hole for Greasing Model CFT** Specification Table⇒B-818

Basically the same as the popular type Cam Follower, this model is provided with tapped holes for piping on the stud head and the thread. It is optimal for locations where an integrated piping for greasing is required.

Model CFT

**Types and Model Numbers of Cam Followers**

The Cam Follower is divided into several types as indicated in Table1.

Table1 Types and Model Numbers of Cam Followers

Type		Popular Type	Eccentric Cam Follower	Containing Thrust Balls
Shape				
Cylindrical outer ring	Stud with a hexagon socket	CF-A (CF...UU-A)	CFH-A (CFH...UU-A)	—
	Stud with a driver groove	CF (CF...UU)	CFH (CFH...UU)	—
	With a tapped hole for greasing	CFT (CFT...UU)	CFHT (CFHT...UU)	—
	Made of stainless steel	CF-M (CF...MUU)	CFH-M (CFH...MUU)	—
Spherical outer ring	Stud with a hexagon socket	CF-R-A (CF...UUR-A)	CFH-R-A (CFH...UUR-A)	CFN-R-A
	Stud with a driver groove	CF-R (CF...UUR)	CFH-R (CFH...UUR)	—
	With a tapped hole for greasing	CFT-R (CFT...UUR)	CFHT-R (CFHT...UUR)	—
	Made of stainless steel	CF-MR (CF...MUUR)	CFH-MR (CFH...MUUR)	—

Cam Follower

Note1) The symbols in the parentheses indicate model numbers of types with seals.

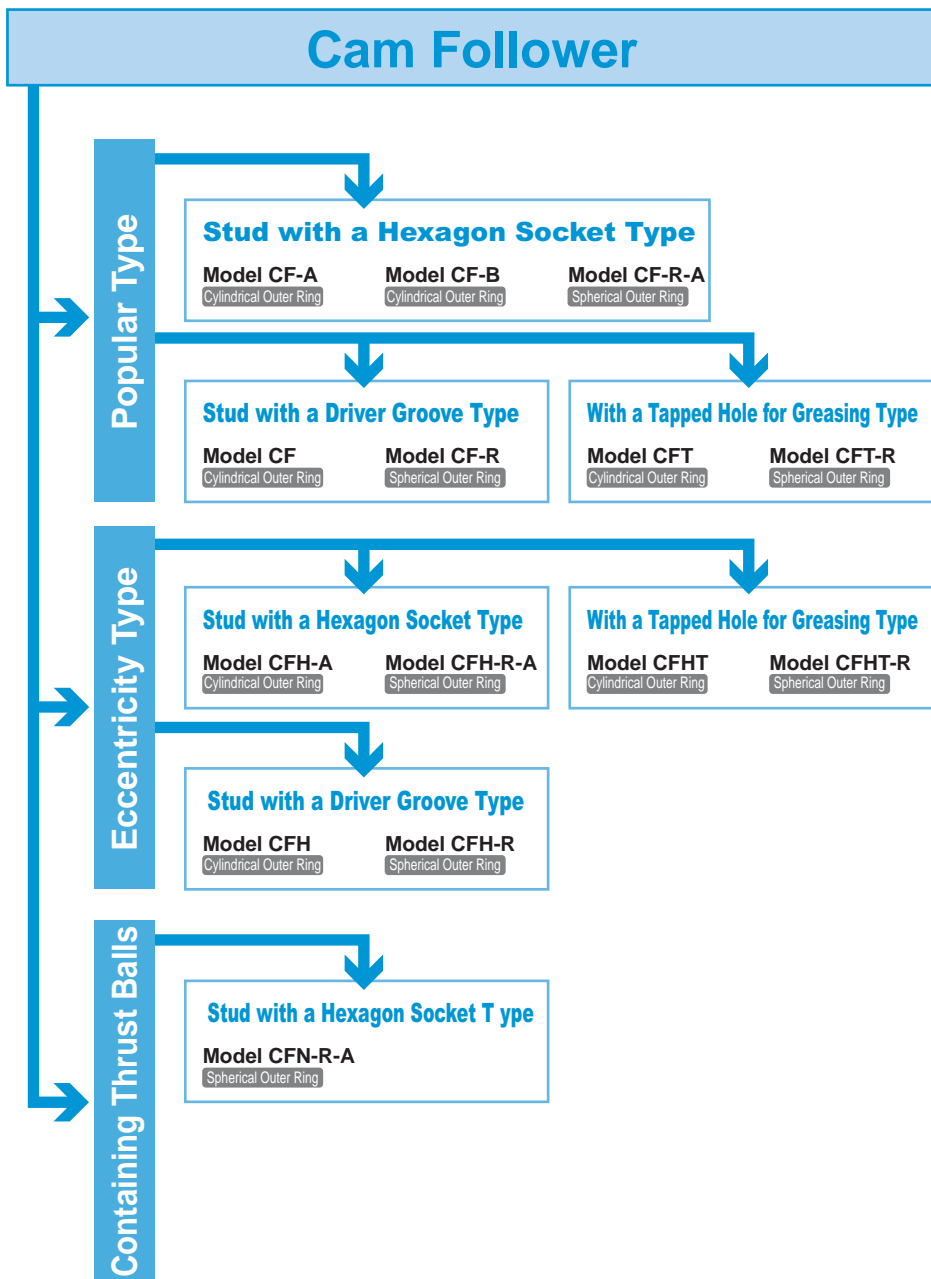

Note2) THK also manufactures low-speed full-roller types with long service lives. For these full-roller types, symbol "V" is indicated.

Note3) Symbol M indicates stainless steel type.

Example: CF 12 V UUR

└ Full-roller type

# Classification Table

## Point of Selection

## Cam Follower

### Nominal Life

#### [Static Safety Factor]

The basic static load rating  $C_0$  refers to the static load with constant direction and magnitude, under which the calculated contact stress in the center of the contact area between the roller and the raceway under the maximum load is 4000 MPa. (If the contact stress exceeds this level, it will affect the rotation.) This value is indicated as "C<sub>0</sub>" in the dimensional tables. When a load is statically or dynamically applied, it is necessary to consider the static safety factor as shown below.

$$\frac{C_0}{P_0} = f_s$$

$f_s$  : Static safety factor in relation to  $C_0$   
(see Table1)

$C_0$  : Basic static load rating (kN)

$P_0$  : Radial load (kN)

The permissible load ( $F_0$ ) indicates the permissible value of the applied load determined by the strength of the stud section of the Cam Follower. Therefore, it is necessary to consider the static safety factor  $f_M$  against  $F_0$  as well as  $f_s$ .

$$\frac{F_0}{P_0} = f_M$$

$f_M$  : Static safety factor in relation to  $F_0$   
(see Table1)

$F_0$  : Permissible load (kN)

$P_0$  : Radial load (kN)

Table1 Static Safety Factor ( $f_s, f_M$ )

Load conditions	Lower limit of $f_s$ and $f_M$
Normal load	1 to 2
Impact load	2 to 3

#### [Nominal Life]

The service life of the Cam Follower is obtained from the following equation.

$$L = \left( \frac{f_T \cdot C}{f_W \cdot P_C} \right)^{\frac{10}{3}} \times 10^6$$

$L$  : Nominal life

(The total number of revolutions that 90% of a group of identical Cam Follower units independently operating under the same conditions can achieve without showing flaking from rolling fatigue)

$C$  : Basic dynamic load rating (kN)

$P_C$  : Radial load (kN)

$f_T$  : Temperature factor

(see Fig.1 on A-886)

$f_W$  : Load factor (see Table2 on A-886)

\* The basic dynamic load rating ( $C$ ) of the Cam Follower shows the load with interlocked direction and magnitude, under which the nominal life ( $L$ ) is 1 million revolutions when a group of identical Cam Follower units independently operate. The basic dynamic load rating ( $C$ ) is indicated in the corresponding specification table.

**[Calculating the Service Life Time]**

When the nominal life (L) has been obtained, the service life time (L<sub>h</sub>) is obtained from the following equation.

● **For Linear Motion**

$$L_h = \frac{D \cdot \pi \cdot L}{2 \times l_s \cdot n_1 \times 60}$$

- L<sub>h</sub> : Service life time (h)
- L : Nominal life
- D : Bearing outer diameter (mm)
- l<sub>s</sub> : Stroke length (mm)
- n<sub>1</sub> : Number of reciprocations per minute (min<sup>-1</sup>)

Fig.1 Temperature Factor (fr)

Note) The normal service temperature is 80 °C or below. If the product is to be used at a higher temperature, contact THK.

● **For Rotary Motion**

$$L_h = \frac{D \cdot L}{D_1 \cdot n \times 60}$$

- D<sub>1</sub> : Outer ring contact average diameter of the cam (mm)
- n : Revolutions per minute of the cam (min<sup>-1</sup>)

Table2 Load Factor (f<sub>w</sub>)

Condition	f <sub>w</sub>
Smooth motion without impact	1 to 1.2
Normal motion	1.2 to 1.5
Motion with severe impact	1.5 to 3

## Accuracy Standards

Cam Followers are manufactured with accuracies according to Table3.

- (1) Dimensional tolerance of the cylindrical outer ring in outer diameter D: Table3
- (2) Dimensional tolerance of the spherical outer ring in outer diameter D:  $\begin{smallmatrix} 0 \\ -0.05 \end{smallmatrix}$
- (3) Dimensional tolerance of the Cam Follower in stud diameter d: h7
- (4) Dimensional tolerance of the outer ring in width B:  $\begin{smallmatrix} 0 \\ -0.12 \end{smallmatrix}$

Table3 Accuracy of the Outer Ring (JIS Class 0)

Unit: μm

Nominal dimension of the bearing outer diameter (D) (mm)		Tolerance of the bearing in outer diameter (Dm) (max)		Tolerance of the outer ring in radial runout (max)
Above	Or less	Upper	Lower	
6	18	0	-8	15
18	30	0	-9	15
30	50	0	-11	20
50	80	0	-13	25
80	120	0	-15	35

Note) "Dm" represents the arithmetic average of the maximum and minimum diameters obtained in measuring the bearing outer diameter at two points.

## Track Load Capacity

The track load capacity means the permissible load at which the outer ring of a bearing and the mating surface are capable of withstanding repeated use over a long period.

The track load capacity provided in the specification table indicates the value when using a steel material with tensile strength of 1.24 kN/mm<sup>2</sup> as the mating material. Therefore, it is possible to increase the track load capacity by increasing the hardness of the material. Fig.2 shows the hardness of the mating material and the track capacity factor in relation to tensile strength. To obtain the track load capacity of each mating material, multiply the track load capacity shown in the corresponding specification table by the respective track load factor.

Fig.2 Track Capacity Factor

Note) For the mating material, we recommend using those materials with the raceway hardness of 20 HRC or higher and the tensile strength of 775 N/mm<sup>2</sup> or higher.

### Example of Calculating a Track Load Capacity

Obtain the track load capacity when heat-treating the mating material, which a bearing whose outer ring has a track load capacity of 5.29 kN contacts, to hardness of 50 HRC.

The track capacity factor when the hardness is 50 HRC is 2.32, as indicated in Fig.2. Therefore, the desired track load capacity is calculated as follows.

$$\text{The track load capacity} = 5.29 \text{ kN} \times 2.32 = 12.3 \text{ kN}$$

## Radial Clearance

The radial clearances of Cam Followers meet clearance C2 (see Table4).

(Normal clearance applies to full-roller types.)

Table4 Radial Clearance Unit: μm

Model No.	Clearance C2 (with cage)		Normal clearance (full rollers)	
	Min.	Max.	Min.	Max.
CF, CFN, CFH, CFT and CFHT				
3 to 4	3	17	10	25
5 to 8	5	20	15	30
10 to 12-1	5	25	15	35
16 to 20-1	10	30	20	40
24 to 30-2	10	40	25	55

## Point of Design

## Cam Follower

### Fit

For the dimensional tolerance of the Cam Follower in stud-mounting hole, we recommend the following fitting.

The dimensional tolerance of the stud-mounting hole: H7

### Installation

#### [Mounting Section]

Establish perpendicularity between the stud-mounting hole and the mounting surface, and chamfer the mouth of the hole to the smallest possible radius, preferably C0.5. Also, the diameter of the mounting surface should preferably be at least equal to the dimension "f" indicated in the specification table.

If the outer ring unilaterally or unevenly contacts the mating raceway, we recommend using model CF-R, whose outer ring circumference is spherically ground.

#### [Mating Raceway]

For the material of the mating raceway, see Track Load Capacity on A-887.

#### [About the Mounting Method]

Do not tap the bracket and directly tighten the product without using a nut as shown in Fig.1. Doing so may result in an insufficient tightening torque, or cause the bending stress to concentrate in the male thread and damage the stud if the thread is loosened.

Fig.1

# Mounting Procedure and Maintenance Cam Follower

## Installation

### [Installing the Cam Follower]

If the Cam Follower is to be used under a heavy load, it is necessary to install the product so that the greasing hole on the stud is out of the loaded area. To help identify the position of the greasing hole, the THK logo is marked on the side face of the stud collar. (See Fig.1.)

The vertical hole in the middle of the stud is used as a whirl stop or a greasing hole.

Make sure that the outer ring is evenly in contact with the mating surface. When installing the Cam Follower, also make sure its axis is perpendicular to the traveling direction.

### ● Tightening Torque for the Stud

Since the stud of the Cam Follower receives bending stress and tensile stress caused by a bearing load, it is necessary to keep the tightening torque of the screw from exceeding the values indicated in Table1.

If the mounting screw may be loosened due to vibrations or impact, use a spring washer, thin nuts of JIS B 1811 Class 3 as double-nuts or a special nut capable of preventing itself from loosening.

Fig.1 Positions of the THK Logo and the Greasing Holes

Table1 Maximum Tightening Torque of the Screw

Model No	Maximum tightening torque N-m
CF, CFN, CFH, CFT	
3	0.392
4	0.98
5	1.96
6	2.94
8	7.84
10 10-1	16.7
12 12-1	29.4
16	70.6
18	98
20 20-1	137
24 24-1	245
30 30-1 30-2	480

Note) 1 N-m equals to 0.102 kgf-m.

### [Installing the Eccentric Cam Follower]

The eccentricity is adjusted in the following steps.

- (1) Insert the stud into the mounting hole, and lightly tighten the nut until the nut starts turning. In doing so, position the THK logo in relation to the load direction as shown in Fig.2.
- (2) Use the hexagon socket on the stud head to turn the stud and adjust the clearance between the stud and the mating contact surface.
- (3) After adjusting the clearance, tighten the nut while keeping the stud from turning. Be sure the maximum tightening torque in Table1 on A-889 is not exceeded.

The surface of the Cam Follower stud is hardened. Take this into account when machining the stud.

The figure shows the position of the THK logo in relation to the eccentricity direction for model CFH12 or higher with a greasing hole.

For model CFH10-1 or lower without a greasing hole, the "O" mark indicates the eccentricity direction. There is no relationship between the THK logo and the eccentricity direction.

Fig.2

## Contamination Protection and Lubrication

The Cam Follower models include seal types (model numbers: "...UU"), which are incorporated with special synthetic rubber seals that are highly resistant to wear in order to prevent foreign material from entering the interior of the cam follower and the lubricant from leaking.

Since each Cam Follower unit with seals contains high-quality lithium soap group grease No. 2, you can start using the product without replenishing grease. Exceptionally, model CFN contains AFC Grease.

If your Cam Follower does not have seals, fill grease from the greasing hole on the stud or the inner ring. However, some of the model numbers with stud diameters of 10 mm or less do not have a greasing hole and are provided with initial lubrication only, and therefore do not allow replenishment of grease.

The appropriate fill quantity is a half to one third of the space inside the bearing. The lubrication interval varies depending on the operating conditions. As a guide, however, replenish grease of the same group every six months to two years for types with a cage, or every one to 6 months for full-roller types.

Even with types equipped with seals ("...UU"), surplus grease may seep during the initial operation period or immediately after resumption of grease replenishment. If desiring to avoid contamination of the surrounding area of the machine by grease, first perform seasoning or the like in advance, and then wipe the seeping surplus grease.

When driving the dedicated grease nipple onto the Cam Follower, use a jig like the one shown in Fig.3 to provide pressure to the flange of the nipple.

Fig.3

## Accessories for the Cam Follower

Table1 shows accessories for standard types of Cam Followers. The dedicated grease nipple is attached at your request. If desiring the dedicated grease nipple, add symbol "N" to the end of the model number.

Example: CF 12 UUR -N

 Dedicated grease nipple

Table1 Accessories

Model No.		Plug <sup>note 1</sup>	Plug <sup>note 2</sup>	Nut JIS Class 2	Grease <sup>note 3</sup>
CF	Without seal	Included in package	Included in package	Included in package	Not contained
	With seal	Included in package	Included in package	Included in package	Filled with grease
CFN		Included in package	Included in package	Included in package	Filled with grease
CFT	Without seal	—	—	Included in package	Not contained
	With seal	—	—	Included in package	Filled with grease

Note1) The plug is used to prevent grease from leaking. However, it is not included in the packages of model CF5, and hexagon socket types of models CFN10 (R)-A and CF (CFH) 10-1 (R)-A or lower.

Note2) The plug is used to close an unused greasing hole. However, it is not attached to model CF (CFH) 10-1 or lower.

Note3) All models without a greasing hole are filled with grease when assembled regardless of whether a seal is attached or not.

Table2 Specification Table for Grease Nipples

Supported models	Nipple dimensions						Nipple model No.
CF, CFN, CFH	d	b	D	h	L	L <sub>1</sub>	
5	3.1	6	7.5	1.5	9	5.5	NP3.2×3.5
6 to 10	4	6	7.5	1.5	10	5.5	PB1021B
12 to 18	6	6	8	2	11	6	NP6×5
20 to 30	8	6	10	3	16	7	NP8×9

Note) The grease nipple is not attached to models CFN10 (R)-A and CF (CFH) 10-1 (R)-A or lower.

## Precautions on Use

## Cam Follower

### [Handling]

- (1) Disassembling components may cause dust to enter the system or degrade mounting accuracy of parts. Do not disassemble the product.
- (2) Dropping or hitting the Cam Follower may damage it. Giving an impact to it could also cause damage to its function even if the product looks intact.

### [Lubrication]

- (1) Some types of the Cam Follower do not contain grease depending on the size and on whether seals are attached. Carefully refer to Table1 on A-892, and if the desired model does not contain grease, apply grease to the product as necessary before using it. Lithium soap-based grease No. 2 is available as standard. (Use THK AFC Grease for model CFN.)
- (2) Do not mix lubricants of different physical properties. In addition, replenish a lubricant also during operation as necessary.
- (3) We recommend applying a lubricant to the mating surface where the Cam Follower travels.

### [Precautions on Use]

- (1) When securing the Cam Follower, use a torque wrench or the like to tighten the product at a torque equivalent to the corresponding value in Table1 on A-889.
- (2) When using the product in locations exposed to vibrations or an impact load or in a special environment such as a clean room, vacuum and low/high temperature, contact THK in advance.
- (3) Entrance of foreign material such as dust may cause damage or functional loss. Prevent foreign material, such as dust and cutting chips, from entering the product.
- (4) Cam Followers are designed for use under a radial load. Do not use the product under a thrust load.

### [Storage]

When storing the Cam Follower, enclose it in a package designated by THK and store it while avoiding high temperature, low temperature and high humidity.

## Features and Types

## Roller Follower

### Features of the Roller Follower

Fig.1 Structure of Roller Follower Model NAST-ZZUU

### Structure and Features

The Roller Follower is a compact and highly rigid bearing system. It contains needle bearings and is used as a guide roller for cam discs and straight motion.

Since its outer ring rotates while keeping direct contact with the mating surface, this product is thick-walled and designed to bear an impact load.

Inside the outer ring, needle rollers and a precision cage are incorporated. This prevents the product from skewing and achieves a superb rotation performance. And, as a result, the product is capable of easily withstanding high-speed rotation.

Roller Followers are divided into two types: separable type whose inner ring can be separated, and non-separable type whose inner ring cannot be separated.

There are two types of the outer ring in shape: spherical and cylindrical. The spherical outer ring easily absorbs a distortion of the shaft center when the cam follower is installed and helps lighten a biased load.

The Roller Follower is used in a wide range of applications such as cam mechanisms of automatic machines, dedicated machines as well as carrier systems, conveyors, bookbinding machines, tool changers of machining centers, pallet changers, automatic coating machines, and sliding forks of automatic warehouses.

## Features and Types

Features of the Roller Follower

# Types of the Roller Follower

## Types and Features

### Model NAST (Separable Type)

Model NAST is a separable type of bearing system that combines a thick-wall outer ring, an inner ring and needle rollers equipped with a precision cage.

[Specification Table⇒B-822](#)

Model NAST

### Model NAST-R (Separable Type)

This model is a spherical outer ring type of model NAST.

Since the circumference of the outer ring is spherically ground, it helps lighten a biased load (symbol R).

[Specification Table⇒B-822](#)

Model NAST-R

### Model NAST-ZZ (Separable Type)

This separable type of bearing system has a labyrinth seal consisting of a pair of side plates formed on both sides of the inner ring of model NAST. (Model number of the type attached with seals is NAST-ZZUU.)

[Specification Table⇒B-823](#)

Model NAST-ZZ

### Model NAST-ZZR (Separable Type)

This model is a spherical outer ring type of model NAST-ZZ.

It easily corrects a distortion of the shaft center when the roller follower is installed.

Since the circumference of the outer ring is spherically ground, it helps lighten a biased load (symbol R). (Model number of the type attached with seals is NAST-ZZUUR.)

[Specification Table⇒B-823](#)

Model NAST-ZZR

## Model RNAS (Separable Type)

Specification Table⇒B-824

This model is basically the same as model NAST, but does not have an inner ring.

Model RNAS

## Model RNAS-R (Separable Type)

Specification Table⇒B-824

This model is basically the same as model NAST-R, but does not have an inner ring. Since the circumference of the outer ring is spherically ground, it helps lighten a biased load (symbol R).

Model RNAS-R

## Model NART-R (Non-separable Type)

Specification Table⇒B-825

This model is a non-separable type of bearing system whose inner ring is fixed to the side plates.

Since the circumference of the outer ring is spherically ground, it helps lighten a biased load (symbol R). (Model number of the type attached with seals is NART-UUR.)

Model NART-R

## Model NART-VR (Non-separable Type)

Specification Table⇒B-825

Based on model NART-R, this model is a full-roller bearing suitable for locations where a heavy load is applied in low speed operation.

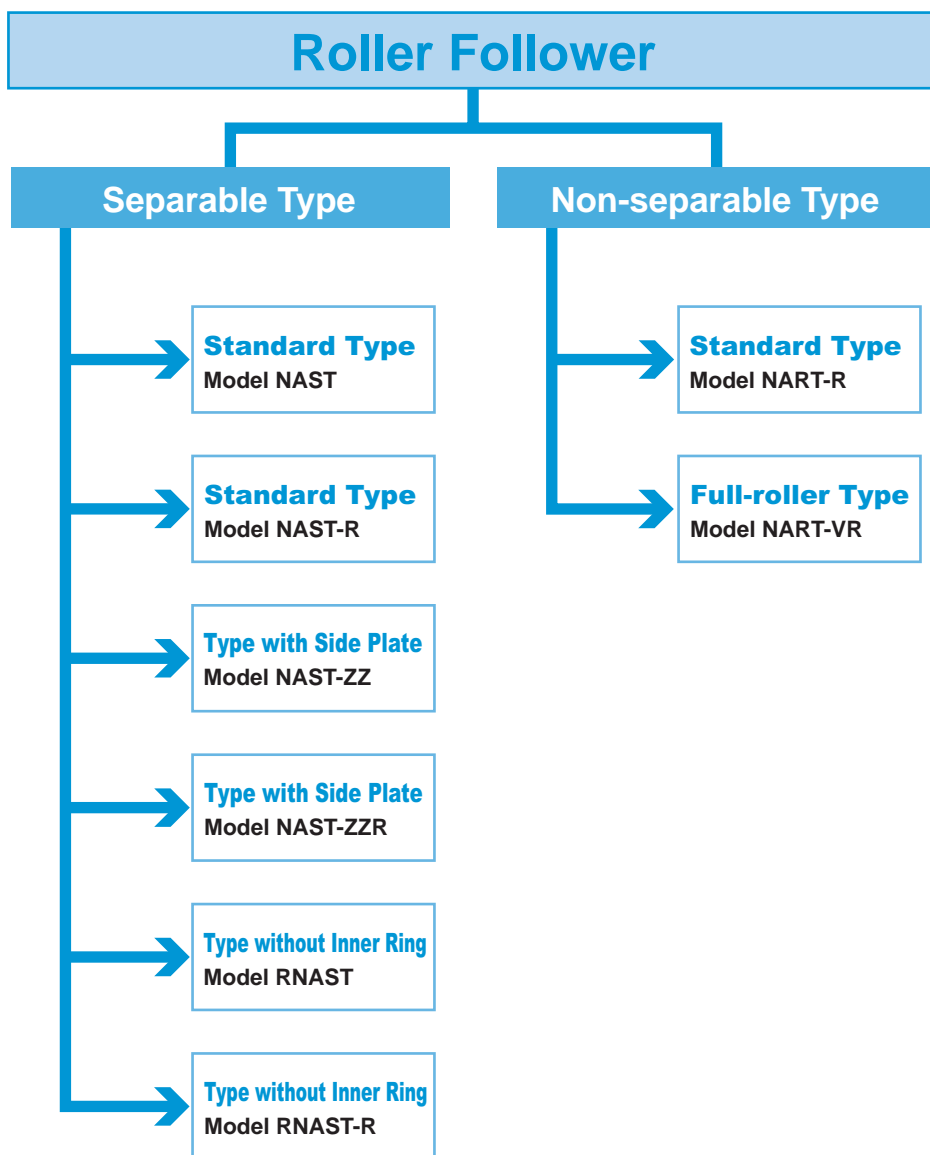

Since the circumference of the outer ring is spherically ground, it helps lighten a biased load (symbol R). (Model number of the type attached with seals is NART-VUUR.)

Model NART-VR

- Stainless steel types are available for all the above models. (symbol M)

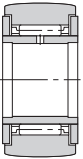

## Types of the Roller Follower

## Types and Model Numbers of the Roller Follower

The Roller Follower is divided into several types as indicated in Table 1.

Table 1 Types of Roller Follower

Classification		Separable type			Non-separable type
		Standard type	Type with side plate	Type without inner ring	Standard type Full-roller type
Main model No.		NAST	NAST-ZZ	RNAST	NART
Shape					
Cylindrical outer ring	Without seal	NAST NAST-M	NAST-ZZ NAST-ZZM	RNAST RNAST-M	—
	With seal	—	NAST-ZZUU NAST-ZZMUU	—	—
Spherical outer ring	Without seal	NAST-R NAST-MR	NAST-ZZR NAST-ZZMR	RNAST-R RNAST-MR	NART-R NART-MR
	With seal	—	NAST-ZZUUR NAST-ZZMUUR	—	NART-UUR NART-MUUR
Full rollers	Without seal	—	—	—	NART-VR NART-VMR
	With seal	—	—	—	NART-VUUR NART-VMUUR

Symbol M indicates stainless steel type.

## Nominal Life

### [Static Safety Factor]

The basic static load rating  $C_0$  refers to the static load with constant direction and magnitude, under which the calculated contact stress in the center of the contact area between the roller and the raceway under the maximum load is 4000 MPa. (If the contact stress exceeds this level, it will affect the rotation.) This value is indicated as "C<sub>0</sub>" in the specification tables. When a load is statically or dynamically applied, it is necessary to consider the static safety factor as shown below.

$$\frac{C_0}{P_0} = f_s$$

$f_s$  : Static safety factor (see Table2)

$C_0$  : Basic static load rating (kN)

$P_0$  : Radial load (kN)

Table2 Static Safety Factor ( $f_s$ )

Load conditions	Lower limit of $f_s$
Normal load	1 to 3
Impact load	3 to 5

### [Nominal Life]

The service life of the Roller Follower is obtained from the following equation.

$$L = \left( \frac{f_T \cdot C}{f_W \cdot P_C} \right)^{\frac{10}{3}} \times 10^6$$

$L$  : Nominal life

(The total number of revolutions that 90% of a group of identical Roller Follower units independently operating under the same conditions can achieve without showing flaking from rolling fatigue)

$C$  : Basic dynamic load rating\* (kN)

$P_c$  : Radial load (kN)

$f_T$  : Temperature factor

(see Fig.1 on A-903)

$f_W$  : Load factor (see Table3 on A-903)

\* The basic dynamic load rating ( $C$ ) of the Roller Follower shows the load with interlocked direction and magnitude, under which the nominal life ( $L$ ) is 1 million revolutions when a group of identical Roller Follower units independently operate. The basic dynamic load rating ( $C$ ) is indicated in the corresponding specification table.

**[Calculating the Service Life Time]**

When the nominal life (L) has been obtained, the service life time (L<sub>h</sub>) is obtained from the following equation.

● **For Linear Motion**

$$L_h = \frac{D \cdot \pi \cdot L}{2 \times l_s \cdot n_1 \times 60}$$

- L<sub>h</sub> : Service life time (h)
- L : Nominal life
- D : Bearing outer diameter (mm)
- l<sub>s</sub> : Stroke length (mm)
- n<sub>1</sub> : Number of reciprocations per minute (min<sup>-1</sup>)

● **For Rotary Motion**

$$L_h = \frac{D \cdot L}{D_1 \cdot n \times 60}$$

- D<sub>1</sub> : Outer ring contact average diameter of the cam (mm)
- n : Rotation speed per minute of the cam (min<sup>-1</sup>)

Fig.1 Temperature Factor (fr)

Note) The normal service temperature is 80 °C or below. If the product is to be used at a higher temperature, contact THK.

Table3 Load Factor (f<sub>w</sub>)

Service condition	f <sub>w</sub>
Smooth motion without impact	1 to 1.2
Normal motion	1.2 to 1.5
Motion with severe impact	1.5 to 3

## Accuracy Standards

Roller Followers are manufactured with accuracies in accordance with the following.

- (1) Dimensional tolerance of the spherical outer ring in outer diameter D:  $\begin{matrix} 0 \\ -0.05 \end{matrix}$
- (2) Dimensional tolerance of model RNAS<sup>T</sup> in inscribed bore diameter dr: F6
- (3) Dimensional tolerance of model NART in bearing width B: Table4
- (4) Accuracy of the inner ring and accuracy of the outer ring in width: Table5
- (5) Accuracy of the outer ring: Table6

Table5 Accuracy of the Inner Ring and Accuracy of the Outer Ring in Width (JIS Class 0)

Unit: μm

Nominal dimension of the bearing inner diameter (di) (mm)	Tolerance of the bearing in outer diameter (dm) <sup>(note)</sup>		Tolerance of the inner ring (or outer ring) in width		Tolerance of the inner ring in radial runout (max)	
	Above	Or less	Upper	Lower		
2.5	10	0	-8	0	-120	10
10	18	0	-8	0	-120	10
18	30	0	-10	0	-120	13
30	50	0	-12	0	-120	15

Note) "dm" represents the arithmetic average of the maximum and minimum diameters obtained in measuring the bearing inner diameter at two points.

Table4 Dimensional tolerance of model NART in bearing width B:

Model No. NART	Dimensional tolerance (h12)	
	Upper limit	Lower limit
5 to 12	0	-0.18
15 to 35	0	-0.21
40 to 50	0	-0.25

Table6 Accuracy of the Outer Ring (JIS Class 0)

Unit: μm

Nominal dimension of the bearing outer diameter (D) (mm)		Tolerance of the bearing in outer diameter (Dm) <sup>(note)</sup>		Tolerance of the outer ring in radial runout (max)
Above	Or less	Upper	Lower	
6	18	0	-9	15
18	30	0	-9	15
30	50	0	-11	20
50	80	0	-13	25
80	120	0	-15	35

Note) "Dm" represents the arithmetic average of the maximum and minimum diameters obtained in measuring the bearing outer diameter at two points.

## Track Load Capacity

The track load capacity means the permissible load at which the outer ring of a Roller Follower and the mating surface are capable of withstanding repeated use over a long period.

The track load capacity provided in the specification table, indicates the value when using a steel material with tensile strength of 1.2 kN/mm<sup>2</sup> as the mating material. Therefore, it is possible to increase the track load capacity by increasing the hardness of the material. Fig.2 shows the hardness of the mating material and the track capacity factor in relation to tensile strength. To obtain the track load capacity of each mating material, multiply the track load capacity shown in the corresponding specification table by the respective track load factor.

Note) For the mating material, we recommend using those materials with the raceway hardness of 20 HRC or higher and the tensile strength of 775 N/mm<sup>2</sup> or higher.

Fig.2 Track Capacity Factor

### [Example of Calculating a Track Load Capacity]

Obtain the track load capacity when heat-treating the mating material, which a bearing whose outer ring has a track load capacity of 5.29 kN contacts, to hardness of 50 HRC. The track capacity factor when the hardness is 50 HRC is 2.32, as indicated in Fig.2. Therefore, the desired track load capacity is calculated as follows.  
 The track load capacity=5.29kN × 2.32=12.3kN

## Radial Clearance

The radial clearances of Roller Followers meet the clearance indicated in the table below. (Normal clearance applies to full-roller types.)

Model NAST, NAST-ZZ Unit: μm

Model No.	Clearance C2 (with cage)	
	Min.	Max.
6	5	20
8 to 12	5	25
15 to 25	10	30
30 to 40	10	40
45 to 50	15	50

Model RNAS T Unit: μm

Model No.	Clearance C2 (with cage)	
	Min.	Max.
5 to 6	5	20
8 to 12	5	25
15 to 25	10	30
30 to 40	10	40
45 to 50	15	50

Model NART Unit: μm

Model No.	Clearance C2 (with cage)		Normal clearance (full rollers)	
	Min.	Max.	Min.	Max.
5 to 6	5	20	15	30
8 to 12	5	25	15	35
15 to 20	10	30	20	40
25 to 40	10	40	25	55
45 to 50	15	50	30	65

## Fit

For the fitting of the Roller Follower with the shaft, we recommend the combinations indicated in Table1.

Table1 Fitting with the Shaft

No Inner Ring	Inner Ring
k5, k6	g6, h6

## Mounting Section

- To protect the side plate of models NART and NAST-ZZ, the height of the mounting section must be equal to or greater than the "a" dimension indicated in the specification table
- The surface hardness of the shaft to be used with a Roller Follower without inner ring must be between 54 and 64 HRC. For the surface roughness, we recommend 0.2  $\mu\text{m}$  Ra or below.
- For the mating raceway, see "Track Load Capacity" on A-904.
- If the outer ring unilaterally or unevenly contacts the mating raceway, we recommend using a type whose outer ring circumference is spherically ground.
- The side plate of model NART is press-fit onto the inner ring. If the plate is pressed under an external force, it may cause abnormal rotation. Do not use the product in the manner that the side plate is pressed.
- The structure of the Roller Follower is designed to receive a radial load. If it receives a thrust load, the side plates or the outer ring may be damaged. Therefore, it is necessary to design the system and install the product so that the generation of a component of the thrust is limited to a minimum.

## Mounting Procedure and Maintenance Roller Follower

### Installation

Fig.1 shows examples of installing the Roller Follower.

- If the Roller Follower is to be used under a heavy load, it is necessary to install the product so that the greasing hole of the inner ring is out of the loaded area.

Fig.1 Examples of Installing the Roller Follower

### Contamination Protection and Lubrication

The Roller Follower models include seal types (model numbers: "...UU"), which are incorporated with special synthetic rubber seals that are highly resistant to wear in order to prevent foreign material from entering the interior of the roller follower and the lubricant from leaking.

Some models are not filled with grease when assembled. When using a model not filled with grease, apply and fill grease to the interior first (lithium-based grease with consistency of No. 2).

Model No.		Grease
NAST(R)	No seal setting	Not filled with grease
RNAST(R)		
NAST-ZZ(R)	Without seal	Filled with grease
NART-(V)R	With seal	

The lubrication interval varies depending on the operating conditions. As a guide, however, replenish grease of the same group every six months to two years for types with a cage, or every one to six months for full-roller types.

Even with types equipped with seals ("...UU"), surplus grease may seep during the initial operation period or immediately after resumption of grease replenishment. If desiring to avoid contamination of the surrounding area of the machine by grease, first perform seasoning or the like in advance, and then wipe the seeping surplus grease.

## Precautions on Use

## Roller Follower

### [Handling]

- (1) Disassembling components may cause dust to enter the system or degrade mounting accuracy of parts. Do not disassemble the product.
- (2) Dropping or hitting the Roller Follower may damage it. Giving an impact to it could also cause damage to its function even if the product looks intact.

### [Lubrication]

- (1) Some types of the Roller Follower do not contain grease depending on the model number. Carefully refer to A-906, and if the desired model does not contain grease, apply grease to the product as necessary before using it. Lithium soap-based grease No. 2 is available as standard.
- (2) Do not mix lubricants of different physical properties. In addition, replenish a lubricant also during operation as necessary.
- (3) We recommend applying a lubricant to the mating surface where the Roller Follower travels.

### [Precautions on Use]

- (1) When using the product in locations exposed to vibrations or an impact load or in a special environment such as a clean room, vacuum and low/high temperature, contact THK in advance.
- (2) Entrance of foreign material such as dust may cause damage or functional loss. Prevent foreign material, such as dust and cutting chips, from entering the product.
- (3) Roller Followers are designed for use under a radial load. Do not use the product under a thrust load.

### [Storage]

When storing the Roller Follower, enclose it in a package designated by THK and store it while avoiding high temperature, low temperature and high humidity.

## Features and Types

## Spherical Plain Bearing

# Features of the Spherical Plain Bearing

### Structure and Features

Spherical Bearings models SB and SA1 are self-aligning plain bearings designed for heavy loads. The inner and outer rings of these models use high-carbon chromium bearing steel that is hardened and ground, are treated with phosphate coating, which is highly resistant to corrosion and wear, and seized with molybdenum disulfide (MoS<sub>2</sub>).

The Spherical Plain Bearing is capable of receiving a large radial load and thrust loads in both directions. Furthermore, because of its high resistance to impact loads, the Spherical Plain Bearing is optimal for low speed, heavy load rocking components such as the cylinder clevises or hinges of construction and civil-engineering machinery and the suspensions of trucks.

## Types of the Spherical Plain Bearing

### Types and Features

#### Model SB

The most popular type of Spherical Plain Bearing in Japan, model SB has wide spherical contact areas and is used as a bearing for heavy loads. The outer ring is split at two points, enabling the inner ring to be accommodated.

[Specification Table⇒B-828](#)

Model SB

#### Model SA1

This type of Spherical Plain Bearing is widely used in Europe. The outer ring is split at one point (outer rings with diameter of  $\phi 100$  or thicker are split at two points), and the width and thickness are smaller than model SB. Thus, this model can be used in small spaces. Types attached with highly dust-preventive dust seals on both ends (model SA1...UU) are also available.

[Specification Table⇒B-830](#)

Model SA1

# Selecting a Spherical Plain Bearing

When selecting a Spherical Plain Bearing, follow the instructions below while referring to the basic dynamic load rating (C) and the basic static load rating (C<sub>0</sub>) indicated in the corresponding specification table, as a measuring stick.

### [Spherical Plain Bearing Service Life G]

The basic dynamic load rating (C) is used to calculate the service life when the bearing oscillates under a load.

The basic dynamic load rating is calculated based on the contact surface pressure of the spherical sliding section.

The Spherical Plain Bearing service life G is expressed in the total number of rocking motions until it becomes impossible for the bearing to perform normal operation due to the increase in the radial clearance or in the temperature of the bearing as a result of wear on the spherical sliding section.

Since the bearing service life is affected by various factors such as the material of the bearing, magnitude and direction of the load, lubrication conditions and sliding speed, the calculated value can be used as an empirical, practical value.

$$G = b_1 \cdot b_2 \cdot b_3 \cdot b_4 \cdot b_5 \frac{3}{Da \cdot \beta} \cdot \frac{C}{P} \times 10^8$$

- G : Bearing service life (total number of rocking motions or total number of revolutions)
- C : Basic dynamic load rating (N)
- P : Equivalent radial load (N)
- b<sub>1</sub> : Load direction factor (see Table1)
- b<sub>2</sub> : Lubrication factor (see Table1)
- b<sub>3</sub> : Temperature factor (see Table1)
- b<sub>4</sub> : Dimension factor (see Fig.1)
- b<sub>5</sub> : Material factor (see Fig.2)
- Da : Spherical diameter (mm) (see the specification table)
- β : Oscillation half angle (degree) (for rotary motion, β=90°)

Table1

Type		b <sub>1</sub>		b <sub>2</sub>		b <sub>3</sub>		
		Load direction		Regular lubrication		Temperature °C		
		Fixed	Alternating	Not provided	Provided	-30 +80	+80 +150	+150 +180
Spherical Plain Bearing	With out seal	1	5	0.08	1	1	1	0.7
	With seal	1	5	0.08	1	1	—	—

Fig.1 Dimension Factor

Fig.2 Material Factor

**[Equivalent Radial Load]**

The Spherical Plain Bearing is capable of receiving a radial load and a thrust load simultaneously. If the magnitude and direction of the load applied are constant, the equivalent radial load is obtained from the following equation.

$$P = Fr + YFa$$

- P : Equivalent radial load (N)  
 Fr : Radial load (N)  
 Fa : Thrust load (N)  
 Y : Thrust load factor (see Table2)

Table2 Thrust Load Factor

Fa/Fr ≤	0.1	0.2	0.3	0.4	0.5
Thrust load factor (Y)	0.8	1	1.5	2.5	3

**[Static Safety Factor f<sub>s</sub>]**

If the Spherical Plain Bearing is to be used under a stationary load or in slight rocking motion, select a model using the basic static load rating (C<sub>0</sub>) as a guide. The basic static load rating refers to the stationary load that the bearing can receive without damaging the bearing and without causing permanent deformation that would prevent smooth motion.

In general, set the safety factor at three or greater taking into account the rigidity of the shaft and the housing.

$$f_s = \frac{C_0}{P} \geq 3$$

- f<sub>s</sub> : Static safety factor  
 C<sub>0</sub> : Basic static load rating  
 P : Equivalent radial load

**[pV Value]**

The permissible sliding speed at which the Spherical Plain Bearing can be used varies depending on the load, lubrication conditions and cooling status. The recommended pV value for continuous motion under a load applied in a constant direction is calculated as follows.

$$pV \leq 400 \text{ N/mm}^2 \cdot \text{mm/sec}$$

If the Spherical Plain Bearing performs adiabatic operation or the load direction changes, the heat produced on the sliding surface easily radiates. Therefore, it is possible to set a higher pV value.

The contact surface pressure (p) of the Spherical Plain Bearing is obtained from the following equation.

$$p = \frac{P}{Da \cdot B}$$

p	: Contact surface pressure	(N/mm <sup>2</sup> )
P	: Equivalent radial load	(N)
Da	: Spherical diameter (see the specification table)	(mm)
B	: Outer ring width (see the specification table)	(mm)

The sliding speed is calculated as follows.

$$V = \frac{\pi \cdot Da \cdot \beta \cdot f}{90 \times 60}$$

V	: Sliding speed	(mm/sec)
β	: Oscillation half angle	(degree)
f	: Number of rocking motions per minute	(min <sup>-1</sup> )

The Spherical Plain Bearing can be used at sliding speed of up to 100 mm/sec in oscillating motion, or up to 300 mm/sec in rotary motion in favorable lubrication status.

**[Example of Calculating a pV Value]**

Assuming that model SB25 is used in a location where the shaft rotates 60 turns per minute at an angle of 40° (oscillation half angle : 20°) and the maximum varying load of 1,500 N is applied, determine whether the model number is appropriate and calculate the service life under these conditions. Assume that the bearing temperature is +80 °C or less and the product is regularly provided with sufficient lubrication. Calculate the pV value and examine if the bearing size is appropriate.

The contact surface pressure (p) is calculated as follows.

$$p = \frac{P}{Da \cdot B} = \frac{1500}{36 \times 18} = 2.31 \text{ N/mm}^2 \quad \left( \begin{array}{l} B: \text{outer ring width of model SB25} = 18 \\ Da: \text{spherical diameter of model SB25} = 36 \end{array} \right)$$

The sliding speed (V) is obtained from the following equation.

$$V = \frac{\pi \cdot Da \cdot \beta \cdot f}{90 \times 60} = \frac{3.14 \times 36 \times \left(\frac{40}{2}\right) \times 60}{90 \times 60} = 25.12 \text{ mm/sec}$$

The pV value is calculated as follows.

$$pV = 58.0 \text{ N/mm}^2 \cdot \text{mm/sec}$$

Since both the pV value and the sliding speed (V) meet the requirements, model SB25 can be used.

Next, calculate the service life of the bearing (G) as follows.

$$G = b_1 \cdot b_2 \cdot b_3 \cdot b_4 \cdot b_5 \cdot \frac{3}{Da \cdot \beta} \cdot \frac{C}{P} \times 10^6$$

$$= 5 \times 1 \times 1 \times 1 \times 2.2 \times \frac{3}{36 \times 20} \times \frac{15300}{1500} \times 10^6 = 4.7 \times 10^7 \text{ (min}^{-1}\text{)}$$

## Accuracy Standards

The dimensional tolerances of the Spherical Plain Bearing are defined as indicated in Table3.

Table3 Accuracy of the Spherical Plain Bearing

Unit:  $\mu\text{m}$

Nominal dimension of the inner diameter (d) and outer diameter (D) (mm)		Tolerance in inner diameter (dm)		Tolerance in outer diameter (Dm)		Tolerance of the inner outer ring in width (B <sub>i</sub> , B <sub>e</sub> )	
Above	Or less	Upper	Lower	Upper	Lower	Upper	Lower
10	18	0	-8	—	—	0	-120
18	30	0	-10	0	-9	0	-120
30	50	0	-12	0	-11	0	-120
50	80	0	-15	0	-13	0	-150
80	120	0	-20	0	-15	0	-200
120	150	0	-25	0	-18	0	-250
150	180	0	-25	0	-25	0	-250
180	250	0	-30	0	-30	0	-300
250	315	—	—	0	-35	0	-350
315	400	—	—	0	-40	0	-400

Note1) "dm" and "Dm" represent the arithmetic averages of the maximum and minimum diameters obtained in measuring the inner and outer diameters at two points.

Note2) The dimensional tolerances of the inner and outer diameters are the values before they are surface treated.

Note3) The dimensional tolerance of the outer ring is the value before it is split.

Note4) Tolerances of the inner and outer diameters in width (B<sub>i</sub>, B<sub>e</sub>) are assumed to be equal, and obtained from the nominal dimension of the inner diameter of the inner ring.

## Radial Clearance

Table4 shows radial clearances of the Spherical Plain Bearing.

Table4 Radial Clearances of the Spherical Plain Bearing

Unit:  $\mu\text{m}$

Bearing inner diameter (d) (mm)		Radial clearance	
Above	Or less	Min.	Max.
—	17	70	125
17	30	75	140
30	50	85	150
50	65	90	160
65	80	95	170
80	100	100	185
100	120	110	200
120	150	120	215
150	240	130	230

Note1) The radial clearance indicates the value before the outer ring is split.

Note2) The axial clearance is approximately twice the radial clearance.

**Point of Selection**

Radial Clearance

Spherical Plain Bearing

## Point of Design

## Spherical Plain Bearing

### Fit

The fitting between the Spherical Plain Bearing and the shaft or the housing is selected according to the conditions. Table1 shows recommended values.

Table1 Recommended Fitting Values

Service condition		Shaft	Housing
Inner ring rotational load	Normal load	k6	H7
	Indeterminate load	m6	H7
Outer ring rotational load	Normal load	g6	M7
	Indeterminate load	h6	N7

Note1) If the product is to be installed so that the inner ring rotates and the fitting with the shaft is to be clearance fitting, harden the surface of the shaft in advance.

Note2) "N7" is recommended for light alloy housings.

#### [Shaft Designing]

If the inner ring is to be fit onto the shaft in loose fitting and the product is to be used under a heavy load, the shaft may slip on the inner circumference of the inner ring. To prevent the slippage, the shaft hardness must be 58 HRC or higher and the surface roughness must be 0.80 a or below.

## Permissible Tilt Angles

The permissible tilt angle of the Spherical Plain Bearing varies according to the shaft shape as indicated in Table2.

Table2 Permissible Tilt Angles  
Unit: degree

Unit: degree

Model No.	Permissible tilt angles		
	$\alpha_1$	$\alpha_2$	$\alpha_3$
SB 12	5	7	18
SB 15	4	6	18

SA1 110	5	6 (4)	15
SA1 120	4	6 (4)	15
SA1 140	5	7 (5)	16
SA1 160	6	8 (6)	13
SA1 180	5	6 (5)	16
SA1 200	6	7 (6)	13
SA1 220	6	8 (6)	15
SA1 240	6	8 (6)	17

Note) The values in the parentheses apply to types attached with a seal.

## Mounting Procedure and Maintenance Spherical Plain Bearing

### Installation

- (1) Do not use the product in the manner that the permissible tilting angle is exceeded since doing so may damage the product.
- (2) The Spherical Plain Bearing is designed for use under a radial load. Do not use the product if the trust load component or the load component in the thrust direction exceeds 50% of the resultant force consisting of the radial load and the thrust load.
- (3) When installing the Spherical Plain Bearing, pay attention to the mounting orientation so that the slit of the outer ring receives a minimum load.

#### [Temperature Range]

The permissible temperature range of the Spherical Plain Bearing is limited between -30°C and 80°C depending on the seal material and determined by the permissible temperature range of the grease used.

### Lubrication

The spherical sliding surface of the Spherical Plain Bearing is seized with a solid lubricant film of molybdenum disulfide. This enables the Spherical Plain Bearing to be used over a relatively long period without further lubrication under a static load, in low-speed rocking motion or in intermittent rotary motion. However, it is generally necessary to replenish grease on a regular basis. If a heavy load is applied, consider using lithium soap group grease containing molybdenum disulfide. The inner and outer rings of the Spherical Plain Bearing have greasing holes as a means to facilitate the flow of the lubricant inside the bearing.

#### [Lubrication Interval]

Since the Spherical Plain Bearing is delivered without being applied with a lubricant, it is necessary to replenish an appropriate amount of grease after installing the Spherical Plain Bearing. We recommend filling grease also to the space surrounding the Spherical Plain Bearing. It is also recommendable to shorten the lubrication interval in the start-up period in order to lighten the initial wear and extend the service life.

The lubrication interval varies according to the magnitude of the load, frequency of the vibrations and other conditions. Provide lubrication while referring to the values in Table1 as a guide.

Table1 Lubrication Interval

Type of load	Required minimum lubrication interval
Unilateral load	G/ 40
Fluctuating load	G/ 180

G: Service life of the bearing (total number of rocking motions or total number of revolutions)

## Contamination Protection

Spherical Bearing model SA1 is provided with a seal designed to prevent humidity or other deleterious material from entering the bearing. This seal is effective in increasing the service life of the bearing. The seal for Spherical Bearing model SA1 is made of oil-resistant synthetic rubber and has double lips as the sealing element. These lips closely contact the spherical inner ring. The seal can be used within the temperature range between  $-30^{\circ}\text{C}$  and  $80^{\circ}\text{C}$ , and is highly resistant to wear and capable of operating for a long period of time. If the product is used in an environment where sand or soil matter may enter the bearing, the service life of the seal is shortened. We recommend lubricating the product on a regular basis.

## Precautions on Use

## Spherical Plain Bearing

### [Handling]

- (1) When installing model SA1 or model SB, they must not be disassembled before installation.
- (2) Dropping or hitting the Spherical Plain Bearing may damage it.  
Giving an impact to it could also cause damage to its function even if the product looks intact.

### [Lubrication]

- (1) For details of the lubrication, see A-918.
- (2) Do not mix lubricants of different physical properties.

### [Precautions on Use]

- (1) When using the product in locations exposed to vibrations or an impact load or in a special environment such as a clean room, vacuum and low/high temperature, contact THK in advance.
- (2) Entrance of foreign material such as dust between the outer and inner rings may cause damage or functional loss. Prevent foreign material, such as dust and cutting chips, from entering the product.

### [Storage]

When storing the Spherical Plain Bearing, avoid high temperature, low temperature and high humidity.

## Features of the Link Ball

Fig.1 Structure of Link Ball Model BL

---

### Structure and Features

---

With the Link Ball, a highly accurate bearing steel ball used in the spherical area is first encased in the holder by die cast molding, and then is specially welded with the shank. This unique process enables the mirror surface of the steel ball to be transferred or duplicated on the spherical surface inside the holder to ensure full contact between the ball and the holder. As a result, smooth motion is achieved with a minimum clearance.

## Features and Types

### Features of the Link Ball

#### [Compact Design]

Model AL has an adequately firm and yet extremely compact shape because of a highly balanced design. Together with use of an A-1 alloy, a light-weight, compact design has been achieved. Thus, this model is optimal for use in an automobile height sensor or transmission control.

#### [Achieves Sphericity of 0.001 mm]

The spherical surface of the shank ball is transferred on the inner surface of the holder while maintaining the sphericity of the bearing steel ball. This allows smooth motion to be achieved with a minimum clearance and provides favorable operability and feel to the link motion.

Sphericity: 0.001 mm

Sphericity of the spherical surface of the ball shank

Roughness of the spherical surface of the ball shank

Roughness of the spherical surface of the holder

Cut sample of the spherical area of model BL

### [Two Types of Holder Material]

Model AL uses the newly developed high strength aluminum alloy "A-1 Alloy" (see A-925), which is light and highly resistant to wear. Models BL, RBL and RBI use the proven, high strength zinc alloy (see A-926).

### [High Lubricity]

Since models AL and BL and those models attached with boots contain grease, they have high lubricity and increased wear resistance.

### [Large Hexagonal Bolt Seat]

The hexagonal bolt seat of the shank has the same dimensions as the seating surface for small hexagon head bolts in accordance with automotive specifications. This prevents the seating surface from sinking and ensures a stable link motion mechanism.

### [Lightweight, High Strength]

Use of the A-1 Alloy enables the Link Ball to achieve mechanical strength approximately twice that of the commonly used aluminum die cast material ADC 12, or almost equal to the high strength zinc alloy, while maintaining aluminum alloys' advantages: lightweight and corrosion resistance.

### [Equipped with a Boot for Protection against Muddy Water]

Use of a boot with high trackability in the ball shank prevents muddy water from entering the spherical area even in a muddy atmosphere. Accordingly, those types equipped with boots are used also in outdoor applications and automobile parts under the chassis. For details, see the muddy water test data (A-930 and A-931).

## Alloy

### [High Strength Aluminum Alloy "A-1 Alloy"]

"A-1 Alloy," a newly developed high strength aluminum alloy, is an alloy with Al-Zn-Si<sub>3</sub> being the main components, is used in the holder of model AL.

#### ● Features of the A-1 Alloy

- Achieves one of the highest strengths among the existing aluminum die cast alloys.
- Has yield strength approximately twice that of the commonly used aluminum die cast alloy (ADC 12).
- Has hardness equal to the high strength zinc alloy and achieves high wear resistance.
- Achieves specific gravity less than a half of the high strength zinc alloy to allow significant weight saving.
- Highly corrosion resistance and can be used as an automotive part related to wheel control.

#### ● Mechanical Properties

Tensile strength	: 343 to 392 N/mm <sup>2</sup>
Tensile yield strength (0.2%)	: 245 to 294 N/mm <sup>2</sup>
Compressive strength	: 490 to 637 N/mm <sup>2</sup>
Compressive yield strength (0.2%)	: 294 to 343 N/mm <sup>2</sup>
Charpy impact	: 0.098 to 0.196 N-m/mm <sup>2</sup>
Elongation	: 2 to 3 %
Hardness	: 140 to 160 HV

#### ● Physical Properties

Specific gravity	: 3
Melting point	: 570°C
Specific heat	: 793 J/(kg·k)
Linear expansion rate	: 22 × 10 <sup>-6</sup>

#### ● Wear Resistance

The result of our test has proven that the wear resistance of the A-1 alloy is equivalent to the high strength zinc alloy.

Rotation-and-rocking durability test between model AL10D (A-1 alloy) and model BL10D (high strength zinc alloy)

<Test conditions>

Item	Description	
Environment temperature	Normal temperature	
Applied load	±1.9kN (perpendicular to the axis) <sup>(note)</sup>	
Loading frequency	0.6Hz	
Kinematic angle	Rotation ±20°	Rocking ±20°
No. of cycles	40 times/min.	40 times/min.
Total No. of cycles	1,000,000 cycles	

Note) For the load direction, see A-927.

<Test result: change in clearance (mm)> Unit: mm

Model No.	AL10D (A-1 alloy)	BL10D (high strength zinc alloy)
Perpendicular to the axis	0.036	0.033
Axial direction	0.052	0.045

### [High Strength Zinc Alloy]

The high strength zinc alloy used in the holders of models BL, RBL, RBI and TBS has been developed as a bearing alloy by mixing Al, Cu, Mg, Be and Ti as well as zinc as the base component. It is excellent in mechanical properties, seizure resistance and wear resistance.

#### ● Composition

Table1 Composition of the High Strength Zinc Alloy

Unit: %

Item	Description
Al	3 to 4
Cu	3 to 4
Mg	0.03 to 0.06
Be	0.02 to 0.06
Ti	0.04 to 0.12
Zn	Remaining portion

#### ● Mechanical Properties

Tensile strength	: 275 to 314 N/mm <sup>2</sup>
Tensile yield strength (0.2%)	: 216 to 245 N/mm <sup>2</sup>
Compressive strength	: 539 to 686 N/mm <sup>2</sup>
Compressive yield strength (0.2%)	: 294 to 343 N/mm <sup>2</sup>
Fatigue strength	: 132 N/mm <sup>2</sup> × 10 <sup>7</sup> (Schenk bending test)
Charpy impact	: 0.098 to 0.49 N-m/mm <sup>2</sup>
Elongation	: 1 to 5%
Hardness	: 120 to 145 HV

#### ● Physical Properties

Specific gravity	: 6.8
Melting point	: 390°C
Specific heat	: 460 J/(kg·k)
Linear expansion rate	: 24 × 10 <sup>-6</sup>

#### ● Wear Resistance

The wear resistance of the high strength zinc alloy is superior to that of class-3 brass and class-3 bronze, almost equal to that of class-2 phosphor bronze.

Amsler wear-tester

Test piece rotation speed	: 185 min <sup>-1</sup>
Load	: 392 N
Lubricant	: Dynamo oil

Fig.2 Wear Resistance of the High Strength Zinc Alloy

## Features and Types

### Features of the Link Ball

## How Load Directions Are Called

Regardless of the shape, the direction of the load applied to the Link Ball is called "axial direction" if it is parallel to the axis of the ball shank, and "perpendicular-to-axis direction" if it is perpendicular to the axis.

## Pushing Load and Pulling Load

Of the loads applied in the axial direction, the load in the direction of the ball shank being pressed toward the holder is called "pushing load" and the load in the direction of the ball shank being pulled from the holder is called "pulling load."

# Performance Tests with the Link Ball

## Tensile Strength Test with Model AL10D

### [Test Method]

Place model AL10D on an Amsler universal testing machine as shown in Fig.3, then apply a load perpendicular to the axis to measure the tensile break load.

### [Test Result]

All samples are broken in the shank, indicating that the holder has sufficient strength.

Sample No.	Breaking load (kN)	Broken point
1	18.82	A
2	18.72	A
3	18.6	A
4	18.78	A
5	18.45	A
6	18.95	A
7	18.65	A
8	18.91	A
9	18.55	A
10	18.5	A
$\bar{X}$	18.693	—
R	0.5	—

## Durability Tests with Link Ball Model AL

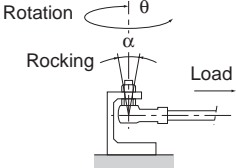

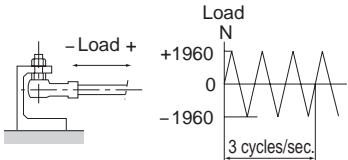

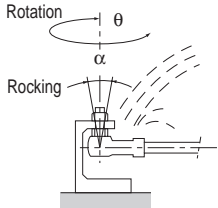

### [Purpose of the Tests]

The tests were conducted to identify the durability of Link Ball model AL while assuming that it is used for automobile suspensions.

### [Tested Product]

Link Ball model AL10D

### [Test Items, Test Conditions and Test Results]

Test item	Test conditions					Load conditions, etc.
	Applied load	Rotation or rocking angle	Frequency	Total number of revolutions or time	Service environment	
Rotation-and-rocking durability	1960N Load direction: Perpendicular to the axis (one direction)	Rotation angle: $\theta = \pm 5^\circ$ Rocking angle: $\theta = \pm 10^\circ$	Rotation: 25 times/min. Rocking: 75 times/min.	500,000 cycles (rocking)	Normal temperature	
Fatigue durability test	$\pm 1960N$ Load direction: Perpendicular to the axis (both directions)	—	180 times/min.	1 million cycles (rocking)	Normal temperature	
Muddy-water rotation-and-rocking durability (identify sealability of the boot)	—	Rotation angle: $\theta = \pm 12^\circ$ Rocking angle: $\theta = \pm 12^\circ$	Rotation: 25 times/min. Rocking: 75 times/min.	500,000 cycles (rocking)	Normal temperature	Discharge muddy water to the boot ● Discharge rate: 1 l/min. ● Contaminates 10% of JIS Class-8 Kanto loamy layer powder 
Boot weathering test	—	—	—	96 hours	-30°C	Left standing
				96 hours	70°C	Left standing
		Rotation angle: $\theta = \pm 10^\circ$	60 times/min.	144 hours	40°C	● Ozone concentration: 80pphm
Salt-water spray resistance test	—	—	—	200 hours	35°C	● Salt-water concentration: 5% ● Spray solution temperature: 33 to 37°C ● Spray pressure: 0.098MPa ● Following spray test, apply pushing load to measure strength

**Features and Types**

**Performance Tests with the Link Ball**

**[Comprehensive Evaluation]**

The results of the durability tests indicate that Link Ball model AL has sufficient strength, wear resistance, corrosion resistance and boot sealability.

This is attributable to the superb characteristics of the newly developed alloy A-1 and the effect of THK's unique manufacturing process. Thus, THK Link Ball model AL provides a high level of performance as a lightweight component.

Link Ball

## Durability Tests with Link Ball Model BL

### [Purpose of the Tests]

The tests were conducted to identify the performance difference between THK Link Ball model BL and an equivalent product of a competitor. As a result, model BL has been used in joints for transmission control units of automobiles, trucks and buses and for steering mechanisms of agricultural tractors.

### [Tested Product, Test Items, Test Conditions and Test Results]

Test item	Tested model No.	Test conditions					
		Applied load	Rotation or rocking angle	Frequency	Total number of revolutions or time	Service environment	Load conditions, etc.
Rotation-and-rocking durability	Comparison of THK Link Ball model BL10D and competitor's product	$\pm 1760\text{N}$ (load direction: perpendicular to the axis)	Rotation angle: $\theta = \pm 20^\circ$ Rocking angle: $\alpha = \pm 20^\circ$	40 times/min.	1,000,000 cycles	Normal temperature	<p>The loading diagram is as follows.</p>  <p>The motion direction is as follows:</p>

**Features and Types**

**Performance Tests with the Link Ball**

**[Comprehensive Evaluation]**

As a result of comparing THK Link Ball model BL10D and a competitor's product in representative durability tests, it is demonstrated that model BL10D is superior in strength and wear resistance of the holder and sealability of the boot.

These features are achieved through THK's unique manufacturing process for the holder and the shank, the material used, the structure of upper and lower grease pockets on the spherical area and the development of a highly sealable boot.

**Summary**

Competitor's product	(1)	240	105	Muddy water penetrated the boot, the spherical area showed chipping and the boot had cuts.	<ul style="list-style-type: none"> <li>The competitor's product cannot be used in environments subject to muddy water since chipping or the like may occur in such environments. In addition, wear of the spherical area reached 0.24 mm, 7.4 times greater than THK model BL10D.</li> </ul>
	(2)	246	107		

Link Ball

## Types of the Link Ball

### Types and Features

#### Model AL

Specification Table⇒B-834

The holder is connected in perpendicular to the shank, which comprises a male thread specially welded with a highly accurate steel ball. With a grease pocket formed on the top and bottom of the spherical area, this model achieves high lubricity and high wear resistance.

Use of the A-1 alloy in the holder significantly reduces the weight.

Model AL

"A-1 Alloy," a high strength aluminum alloy newly developed for the Link Ball, has yield strength approximately twice that of the commonly used aluminum die cast material ADC 12, and its strength and wear resistance are equivalent to the high strength zinc alloy.

With its specific gravity less than that of the high strength zinc alloy, model AL is optimal as an automotive part that requires lightweight, high strength, high corrosion resistance and high wear resistance.

Fig.4 Tensile Strength and Yield Strength of THK A-1 Alloy and ADC 12

#### Model BL

Specification Table⇒B-836

A compact type of model RBL, this model's holder made of the high strength-zinc alloy is connected in perpendicular to the shank, which is incorporated with a ball.

With a grease pocket formed on the top and bottom of the spherical area, this model achieves high lubricity and high wear resistance.

Model BL

## Features and Types

### Types of the Link Ball

#### Model RBL

The holder made of the high strength zinc alloy is connected in perpendicular to the shank, which is incorporated with a ball.

Since grease is contained in the boot, this model achieves high lubricity and high wear resistance.

[Specification Table⇒B-838](#)

Model RBL

#### Model RBI

With this Link Ball model, the high strength zinc alloy is used in its holder and the mounting bolt and the holder are arranged on the same axis, allowing this model to receive both a compressive load and a pulling load.

Since grease is contained in the boot, this model achieves high lubricity and high wear resistance.

[Specification Table⇒B-840](#)

Model RBI

#### Model TBS

The rolled thread on the circumference of the outer ring allows this model to easily be mounted on the housing. Simply by tightening the screw, the user can achieve play-free, firm installation.

Since the coating area of sphere is large, the model is capable of receiving a large axial load.

[Specification Table⇒B-842](#)

Model TBS

## Selecting a Link Ball

The selected bearing must meet both the permissible load obtained from equation (1) and the dynamic load capacity obtained from equation (2).

### [Permissible Load P]

The yield-point strength indicated in the specification tables refers to the mechanical strength of the bearing. With models AL, BL and RBL, the yield point strength indicates the strength when a load is applied perpendicular to the ball shank axis. With model RBL, it indicates the strength when an axial load is applied to the holder in the shank axis direction.

Table1 Safety Factor ( $f_s$ )

Type of load	Lower limit of $f_s$
Constant load in a constant direction	2 to 3
Fluctuating load in a constant direction	3 to 5
Load in varying directions	5 to 8

According to the type of the load, select a bearing that satisfies the following equation from a mechanical strength's viewpoint.

$$P \leq \frac{P_k}{f_s} \quad \dots\dots\dots(1)$$

P : Permissible Load (N)

$P_k$  : Yield-point strength (N)

$f_s$  : Safety factor (see Table1)

### [Dynamic Load Capacity $C_d$ ]

The dynamic load capacity ( $C_d$ ) refers to the upper limit of load that the spherical area of the Link Ball can receive without showing seizure while the Link Ball is rotating or oscillating. The dynamic load capacity is obtained from the following approximation formula using the static load capacity ( $C_s$ ) (note) indicated in the dimensional table.

$$C_d = \frac{C_s}{\sqrt[3]{n}} \quad \dots\dots\dots(2)$$

$C_d$  : Dynamic load capacity (N)

$C_s$  : Static load capacity (N)

n : Rotation speed per minute ( $\text{min}^{-1}$ )

Note) Static load capacity ( $C_s$ ) refers to the value obtained by multiplying the projected area on the spherical section by the permissible surface pressure, and is used to obtain the dynamic load capacity.

## Permissible Tilt Angles

The permissible tilting angles of Link Ball models are indicated in the corresponding specification tables.

Note) If the permissible tilt angle is exceeded, it may cause serious damage to the holder or the boot. Be sure to use the Link Ball within its permissible tilt angle.

## Installation

## Link Ball

### Example of Installation

[Comparison of THK Link Ball and the Conventional Rod End]

THK model BL

Conventional Rod End model PHS

- Since it has a shaft, model BL can easily be installed (especially useful for rod assembly).
- Because of the improved shape of the boot lip, the spherical area is protected from muddy water even in a muddy atmosphere.
- Since it contains grease, it can be used without further lubrication. (with the boot attached)
- Unlike the conventional type, which has a clearance between the shaft and the inner circumference of the inner ring and cannot be fixed completely, model BL has minimum distortion and high rigidity since the shank is integrated with the ball.

[Examples of Installing Model RBI]

Joint for cylinder end metal fitting

Suspending a light object

Connecting a rod in the axial direction

Rotation support

## Precautions on Use

## Link Ball

### [Temperature Range]

The temperature range of the Link Ball series is basically between -20°C and 80°C. If the service temperature exceeds this range, contact THK(see examples of testing the product at temperature other than the above temperature range on A-930 to A-933)

### [Handling]

Dropping or hitting the Link Ball may damage it. Giving an impact to it could also cause functional damage to it even if the product looks intact.

### [Lubrication]

- (1) All Link Ball models except model TBS contain lithium soap-based grease in their boots and can be used without further greasing. For model TBS and those models without boot, apply grease to the spherical section as necessary.
- (2) Do not mix lubricants of different physical properties.

### [Precautions on Use]

- (1) Do not use the product in the manner that the permissible tilting angle is exceeded since doing so may damage the product.
- (2) When using the product in locations exposed to vibrations or an impact load or in a special environment such as a clean room, vacuum and low/high temperature, contact THK in advance.
- (3) Entrance of foreign material such as dust between the holder and the inner ring may cause damage or functional loss. Prevent foreign material, such as dust and cutting chips, from entering the product.
- (4) Models AL, BL and RBL are designed for use under a load in the direction perpendicular to the axis, while models RBI and TBS are designed for use under an axial load. Take this into account when selecting a model.

### [Storage]

When storing the Link Ball, avoid high temperature, low temperature and high humidity.

## Features and Types

## Rod End

# Features of the Rod End

## Features

The Rod End is a self-aligning plain bearing that uses a spherical inner ring which has the same level of accuracy and hardness as bearing steel balls. With the combination of a spherical inner ring whose sliding surface is mirror-finished and a rationally designed holder, the Rod End ensures play-free, extremely smooth rotation and oscillation.

## Special Bearing Alloy

### [High Strength Zinc Alloy]

The high strength zinc alloy, developed as an alloy for bearings, is composed of Al, Cu, Mg, Be and Ti as well as zinc as the base. It is excellent in mechanical properties, seizure resistance and wear resistance.

### ● Composition

Table1 Composition of the High Strength Zinc Alloy

Unit: %

Item	Description
Al	3 to 4
Cu	3 to 4
Mg	0.03 to 0.06
Be	0.02 to 0.06
Ti	0.04 to 0.12
Zn	Remaining portion

### ● Mechanical Properties

Tensile strength	: 275 to 314 N/mm <sup>2</sup>
Tensile yield strength (0.2%)	: 216 to 245 N/mm <sup>2</sup>
Compressive strength	: 539 to 686 N/mm <sup>2</sup>
Compressive yield strength (0.2%)	: 294 to 343 N/mm <sup>2</sup>
Fatigue strength	: 132 N/mm <sup>2</sup> × 10 <sup>7</sup> (Schenk bending test)
Charpy impact	: 0.098 to 0.49 N-m/mm <sup>2</sup>
Elongation	: 1 to 5%
Hardness	: 120 to 145 HV

## Features and Types

### Features of the Rod End

#### ● Physical Properties

Specific gravity	: 6.8
Melting point	: 390°C
Specific heat	: 460 J/ (kg·k)
Linear expansion rate	: $24 \times 10^{-6}$

#### ● Wear Resistance

The wear resistance of the high strength zinc alloy is superior to that of class-3 brass and class-3 bronze, almost equal to that of class-2 phosphor bronze.

Amsler wear-tester

Test piece rotation speed : 185 min<sup>-1</sup>

Load : 392 N

Lubricant : Dynamo oil

Fig.1 Wear Resistance of the High Strength Zinc Alloy

## Performance Test with the Rod End

This test has been conducted to identify the difference in performance between THK Rod End model HS and an equivalent product by a competitor.

### [Wear Test Conditions]

Item	Description
Subject Rod End	THK: Model HS8 Stainless steel model equivalent of the above
Type of test	Rocking test
Applied load	$\pm 1,180$ N in the radial direction
Kinematic angle	Oscillation angle: $2\theta=40^\circ (\pm 20^\circ)$
Lubrication	No lubrication
Number of cycles per minute	60opm
Total number of cycles	1 million cycles
Testing equipment	Bench testing machine (normal temperature)

The applied load diagram is shown below.

The kinematic angle is shown below.

### [Result of the Wear Test]

Table2 Change in the Spherical Clearance Unit: mm

Abrasion loss after 1-million-cycle test			
Model No.	Number of times	Rocking test	
		Radial direction	Axial direction
HS 8	Initial stage (at start-up)	0.008	0.01
	1 million cycles	0.035	0.075
	Change	0.027	0.065
Stainless steel model equivalent of the above	Initial stage (at start-up)	0.005	0.005
	40,000 cycles	0.22	0.2
	Change after 40,000 cycles	0.215	0.065
	Note: The holder is elongated and fractured after 76,300 cycles.		

- (1) Although model HS8 withstood the repeated durability test with an applied load of  $\pm 1,180$  N and the total number of cycles being 1 million, the holder of the stainless steel equivalent model was elongated and fractured after only 76,300 cycles.
- (2) The result shows that the increase in wear of model HS8 in the radial direction since the initial wear (approximately 100,000 cycles) was minimal.

# Types of the Rod End

## Types and Features

### Type Provided with a Female Threading - Model PHS

[Specification Table⇒B-846](#)

With model PHS, a special copper alloy with high conformability is inserted between the chromate treatment steel holder and the spherical inner ring in which only the circumference of the spherical area is hard chrome plated. This structure ensures high rigidity, high wear resistance and high corrosion resistance.

The grease nipple on the holder allows grease to be applied to the sliding surface as necessary.

Model PHS

### Die Cast, Low Price Type - Model RBH

[Specification Table⇒B-848](#)

This model is a high-accuracy, low cost rod end in which the spherical inner ring serves as the core and the holder is formed by die casting.

The holder is made of a high strength zinc alloy (see A-942), which is superb in mechanical properties and bearing characteristics.

Model RBH

### No Lubrication Type - Model NHS-T

[Specification Table⇒B-850](#)

This no lubrication rod end uses self-lubricating synthetic resin formed between the steel holder and the spherical inner ring.

Since the clearance on the sliding surface is minimized, an accurate link motion is achieved.

Model NHS-T

### Male thread Type - Model POS

[Specification Table⇒B-852](#)

This model is a highly rigid rod end that is basically the same as the female threading type model PHS, but has a male thread on the holder end.

Model POS

## No Lubrication, Male thread Type - Model NOS-T

[Specification Table⇒B-854](#)

This model is a no lubrication rod end that is basically the same as the female threading type model NHS-T, but has a male thread on the holder end.

Model NOS-T

## Standard Type - Model PB

[Specification Table⇒B-856](#)

With model PB, a special copper alloy with high conformability is inserted between the steel outer ring and the spherical inner ring in which only the spherical area is hard chrome plated. This structure makes this model a high rigid Spherical Plain Bearing with high corrosion resistance and high wear resistance.

The oil groove and the greasing hole on the outer ring allow grease to be applied to the sliding surface as necessary.

Model PB

## Die Cast Type - Model PBA

[Specification Table⇒B-857](#)

This model is a high-accuracy, low cost Spherical Plain Bearing in which the spherical inner ring serves as the core and the outer ring is formed by die casting.

The outer ring is made of a high strength zinc alloy (see A-942), which is superb in bearing characteristics.

Model PBA

## No Lubrication Type - Model NB-T

[Specification Table⇒B-858](#)

This no lubrication bearing uses self-lubricating synthetic resin formed between the steel outer ring and the spherical inner ring.

Model NB-T

## Features and Types

### Types of the Rod End

[Build to Order]

## No Lubrication, Corrosion-resistant Type - Model HS

[Specification Table⇒B-860](#)

This no lubrication Spherical Plain Bearing uses a special fluorine sheet adhering to the holder's spherical area. The holder is made of an aluminum alloy.

This product is built to order. Contact THK for details.

Model HS

[Build to Order]

## No Lubrication Type - Model HB

[Specification Table⇒B-862](#)

This no lubrication Spherical Plain Bearing uses a special fluorine sheet adhering to the outer ring's spherical area.

This product is built to order. Contact THK for details.

Model HB

## Selecting a Rod End

### [Permissible Load P]

The static load capacity ( $C_s$ ) indicated in the specification tables, is presented as a guide for the mechanical strength of the Rod End. Select a bearing while taking into account the safety factor ( $f_s$ ) indicated in Table1 according to the type of the load.

Table1 Safety Factor ( $f_s$ )

Type of load	Lower limit of $f_s$
Constant load in a constant direction	2 to 3
Fluctuating load in a constant direction	3 to 5
Load in varying directions	5 to 8

According to the type of load, select a bearing that satisfies the following equation from a mechanical strength's viewpoint.

$$P \leq \frac{C_s}{f_s} \quad \dots\dots\dots(1)$$

- P : Permissible Load (N)  
 $C_s$  : Static load capacity (N)  
 $f_s$  : Safety factor (see Table1)

### [Dynamic Load Capacity $C_d$ ]

The dynamic load capacity refers to the upper limit of load that the spherical area can receive without showing seizure while the Rod End is rotating or oscillating. The dynamic load capacity is obtained from the following approximation formula using the static load capacity ( $C_s$ ) <sup>(note 1)</sup> indicated in the specification table.

$$C_d = \frac{C_s}{\sqrt[3]{n}} \quad \dots\dots\dots(2)$$

- $C_d$  : Dynamic load capacity (N)  
 $C_s$  : Static load capacity (N)  
 n : Rotation speed per minute ( $\text{min}^{-1}$ )

The selected bearing must meet both the permissible load obtained from equation (1) and the dynamic load capacity obtained from equation (2).

Note1) Static load capacity ( $C_s$ ) refers to the value obtained by multiplying the projected area on the spherical section by the permissible surface pressure, and is used to obtain the dynamic load capacity.

## Permissible Tilt Angles

The permissible tilt angles  $\alpha_1$ ,  $\alpha_2$  and  $\alpha_3$  of the Rod End are indicated in Table 1.

Table 1 Permissible Tilt Angles

Model No.	Permissible tilt angles		
	$\alpha_1$	$\alpha_2$	$\alpha_3$
NHS 3T, NOS 3T	8	10	42
NHS 4T, NOS 4T	9	11	35
PHS 5, RBH 5, NHS 5T, POS 5, NOS 5T, PB 5, PBA 5	8	13	30
PHS 6, RBH 6, NHS 6T, POS 6, NOS 6T, PB 6, PBA 6	8	13	30
PHS 8, RBH 8, NHS 8T, POS 8, NOS 8T, PB 8, PBA 8	8	14	25
PHS 10, RBH 10, NHS 10T, POS 10, NOS 10T, PB 10, PBA 10	8	14	25
PHS 12, RBH 12, NHS 12T, POS 12, NOS 12T, PB 12, PBA 12	8	13	25
PHS 14, RBH 14, NHS 14T, POS 14, NOS 14T, PB 14, PBA 14, NB 14T	10	16	24
PHS 16, RBH 16, NHS 16T, POS 16, NOS 16T, PB 16, PBA 16, NB 16T	9	15	24
PHS 18, RBH 18, NHS 18T, POS 18, NOS 18T, PB 18, PBA 18, NB 18T	9	15	24
PHS 20, RBH 20, NHS 20T, POS 20, NOS 20T, PB 20, PBA 20, NB 20T	9	15	24
PHS 22, RBH 22, NHS 22T, POS 22, NOS 22T, PB 22, PBA 22, NB 22T	10	15	23
PHS 25, POS 25, PB 25	9	15	23
PHS 30, POS 30, PB 30	10	17	23

## Installation

Please note that the Rod End is not capable of receiving a thrust load indicated in Fig.1.

Fig.1 Examples of Installing the Rod End

## Precautions on Use

## Rod End

### [Service Temperature]

If any of models RBH, PBA, HS and HB, all of which use the high strength zinc alloy and an aluminum alloy in the holder and the outer ring, and of models NHS-T, NOS-T and NB-T, which use synthetic-resin bushes, is to be used at temperature of 80 °C or higher, or receives an impact at low temperature, contact THK.

### [Handling]

Dropping or hitting the Rod End may damage it. Giving an impact to it could also cause damage to its function even if the product looks intact.

### [Lubrication]

All Rod End models except lubrication-free types must be greased before being used (lithium soap-based grease No. 2 is recommended). When greasing the Rod End before using it, do not mix lubricants of different physical properties. In addition, replenish a lubricant also during operation as necessary.

### [Precautions on Use]

- (1) Do not use the product in the manner that the permissible tilting angle is exceeded since doing so may damage the product.
- (2) When using the product in locations exposed to vibrations or an impact load or in a special environment such as a clean room, vacuum and low/high temperature, contact THK in advance.
- (3) Entrance of foreign material such as dust between the holder and the inner ring may cause damage or functional loss. Prevent foreign material, such as dust and cutting chips, from entering the product.
- (4) The Rod End is designed for use under a radial load. Do not use the product under a thrust load.

### [Storage]

When storing the Rod End, avoid high temperature, low temperature and high humidity.

## Lubrication

## Accessories for Lubrication

When using an LM system, it is necessary to provide effective lubrication. Without lubrication, the rolling elements or the raceway may be worn faster and the service life may be shortened.

A lubricant has effects such as the following.

- (1) Minimizes friction in moving elements to prevent seizure and reduce wear.
- (2) Forms an oil film on the raceway to decrease stress acting on the surface and extend rolling fatigue life.
- (3) Covers the metal surface to prevent rust formation.

To fully bring out an LM system's functions, it is necessary to provide lubrication according to the conditions.

Even with an LM system with seals, the internal lubricant gradually seeps out during operation. Therefore, the system needs to be lubricated at an appropriate interval according to the conditions.

## Types of Lubricants

LM systems mainly use grease or sliding surface oil for their lubricants.

The requirements that lubricants need to satisfy generally consist of the following.

- (1) High oil film strength
- (2) Low friction
- (3) High wear resistance
- (4) High thermal stability
- (5) Non-corrosive
- (6) Highly anti-corrosive
- (7) Minimal dust/water content
- (8) Consistency of grease must not be altered to a significant extent even after it is repeatedly stirred.

For lubricants that meet these requirements, see A-955.

## Grease Lubrication

Greasing intervals vary depending on the conditions and environments. For normal use, we recommend greasing the system approximately every 100 km of travel distance.

Normally, replenish grease of the same group from the grease nipple or greasing hole provided on the LM system. Mixing different types of grease may deteriorate the system's performance, such as increased consistency.

Lubricant	Type	Brand name
Grease	Lithium-based grease (JIS No. 2) Urea-based grease (JIS No. 2)	AFA Grease (THK) see A-959 AFB-LF Grease (THK) see A-960 AFC Grease (THK) see A-961 AFE-CA Grease (THK) see A-963 AFF Grease (THK) see A-965 AFG Grease (THK) see A-968 Albania Grease No.2 (Showa Shell Sekiyu) Daphne Exponex Grease No.2 (Idemitsu) or equivalent

\* Recommended greases vary according to the conditions and environment. See A-958 to A-969 for details.

## Oil Lubrication

LM systems that require oil lubrication are shipped with only anti-rust oil applied. When placing an order, specify the required lubricant oil. If the LM system is to be mounted other than in horizontal orientation, part of the raceway may be poorly lubricated. Therefore, be sure to inform us of the mounting orientation of the LM system. (For details on mounting orientations, see A-58.)

- The amount of oil to be supplied varies with stroke length. For a long stroke, increase the lubrication frequency or the amount of oil so that an oil film reaches the stroke end of the raceway.
- In environments where a liquid coolant is splattered, the lubricant will be mixed with the coolant, and this can result in the lubricant being emulsified or washed away, causing significantly degraded lubrication performance. In such settings, apply a lubricant with high viscosity (kinematic viscosity: approx. 68 cst) and high emulsification-resistant, and adjust the lubrication frequency or the amount of the feed lubricant.

For machine tools and similar devices that are subject to heavy loads and require high rigidity and operate at high speed, it is advisable to apply oil lubrication.

- Make sure that lubrication oil normally discharges from the ends of your lubrication piping, i.e., the oiling ports that connect to your LM system.

Lubricant	Type	Brand name
Oil	Sliding surface oil or turbine oil ISOVG32 to 68	Super Multi 32 to 68 (Idemitsu) Vactra No.2S (ExxonMobile) DT Oil (ExxonMobile) Tonner Oil (Showa Shell Sekiyu) or equivalent

## Lubrication under Special Environments

For use under special conditions, such as continual vibrations, clean room, vacuum, low temperature and high temperature, normal grease may not be used in some cases. For lubricants that meet such conditions, contact THK.

Table1 Lubricants Used under Special Environments

Service environment	Lubricant characteristics	Brand name
High-speed moving parts	Grease with low torque and low heat generation	AFG Grease(THK) see A-968 AFA Grease(THK) see A-959 NBU15(NOK Kluba) Multemp (Kyodo Yushi) or equivalent
Vacuum	Fluorine based vacuum grease or oil (vapor pressure varies by brand) <small>Note 1</small>	Fomblin Grease (Solvay Solexis) Fomblin Oil (Solvay Solexis) Barrierta IEL/V (NOK Kluba) Isoflex(NOK Kluba) Krytox (Dupont)
Clean room	Grease with very low dust generation	AFE-CA Grease(THK) see A-963 AFF Grease(THK) see A-965
Environments subject to microvibrations or microstrokes, which may cause fretting corrosion	Grease that easily forms an oil film and has high fretting resistance	AFC Grease(THK) see A-961
Environments subject to a spattering coolant such as machine tools	Highly anti-corrosive, refined mineral oil or synthetic oil that forms a strong oil film and is not easily emulsified or washed away by coolant Water-resistant grease <small>Note 2</small>	Super Multi 68 (Idemitsu) Vactra No.2S (ExxonMobile) or equivalent

Note1) When using a vacuum grease, be sure that some brands have starting resistances several times greater than ordinary lithium-based greases.

Note2) In an environment subject to a spattering water-soluble coolant, some brands of intermediate viscosity significantly decrease their lubricity or do not properly form an oil film. Check the compatibility between the lubricant and the coolant.

Note3) Do not mix greases with different physical properties.

## Lubrication Methods

There are roughly three methods of lubricating LM systems: manual lubrication using a grease gun or manual pump; forced oiling with the aid of an automatic pump; and oil-bath lubrication.

### Manual Lubrication

Generally, grease is replenished periodically, fed through a grease nipple provided on the LM system, using a grease gun. (Fig.1)

For systems that have many locations to be lubricated, establish a centralized piping system and periodically provide grease from a single point using a manual pump. (Fig.2)

Fig.1 Lubrication Using a Grease Gun

Fig.2 Lubrication through a Centralized Piping System

Note) When a centralized piping system is used, lubricant may not reach the pipe end due to the viscous resistance inside the pipe. Select the right type of grease while taking into account the consistency of the grease and the pipe diameter.

### Forced Lubrication Method

In this method, a given amount of lubricant is forcibly fed at a given interval. Normally, the lubricant is not collected after use. (Fig.3)

Although a special lubrication system using a piping or the like needs to be designed, this method reduces the likelihood of forgetting to replenish lubricant.

This method is used mainly for oil lubrication. If using grease, it is necessary to examine the appropriate piping diameter and the required grease consistency.

Fig.3 Forced Lubrication Method

## Lubrication Accessory Series for LM Systems

THK provides a wide array of lubrication accessories such as grease, grease guns, grease nipples and plumbing fixtures available for various applications. (A-959 to A-970)

### THK Original Grease

THK provides various types of THK original greases needed for the lubrication of LM systems. They are available for various conditions and environments.

#### [Table for Grease Selection]

Refer to the table below that allows you to select a type of grease according to the application of the LM system.

Also note that the color of the decorative package varies according to the type (both 70 g and 400 g).

Name of grease		AFA Grease	AFB-LF Grease	AFC Grease	AFE-CA Grease	AFF Grease	AFG Grease
Features		Long service life	All-purpose grease	High-speed/micro-vibration grease	Grease for clean environment	Grease for clean environment	Grease for heat of Ball Screw
Base oil		high-grade synthetic oil	refined mineral oil	high-grade synthetic oil	high-grade synthetic oil	high-grade synthetic oil	high-grade synthetic oil
Consistency enhancer		Urea-based	Lithium-based	Urea-based	Urea-based	Lithium-based	Urea-based
Service Temperature Range (°C)		-45 to 160	-15 to 100	-54 to 177	-40 to 160 (200)	-40 to 120	-45 to 160

#### Model number coding

● Type of packing: ● bellows cartridge

**AFC + 70**

Cartridge capacity (70 g / 400 g)

Type of grease (AFA Grease, AFB-LF Grease, AFC Grease, AFE Grease, AFF Grease, AFG Grease)

## THK Original Grease AFA Grease

- Base oil: high-grade synthetic oil
- Consistency enhancer: urea-based

AFA Grease is a high-grade, long-life grease developed with a urea-based consistency enhancer using a high-grade synthetic oil as the base oil.

### [Features]

- Long service life**  
Unlike ordinary soap based grease for metal lubrication, AFA Grease excels in antioxidation stability and therefore can be used for a long period of time.
- Wide temperature range**  
The lubricating performance remains high over a wide range of temperatures from -45 °C to +160°C.  
Even at low temperatures, AFA Grease requires only a low starting torque.
- High water resistance**  
AFA Grease is less vulnerable to moisture penetration than other types of grease because of its high water resistance.
- High mechanical stability**  
AFA Grease is not easily softened and demonstrates excellent mechanical stability even when used for a long period of time.

### [Representative Physical Properties]

### [Rotation Torque Testing with Ball Screw Grease]

<Test method>

Apply 1 cc of grease to the LM Guide of KR4620A+640L and 2 cc to the Ball Screw (initial lubrication only), and then measure the torque at each motor rotation speed.

In torque measurement, output values on the driver torque monitor are used.

Comparative Table of Rotation Torque of Ball Screws by Grease

Unit: N·cm

Grease	Central value of dynamic viscosity CST (mm <sup>2</sup> /S)(40°C)	Dynamic viscosity range CST (mm <sup>2</sup> /S)(40°C)	Rotational speed			
			100min <sup>-1</sup>	1000min <sup>-1</sup>	2000min <sup>-1</sup>	4000min <sup>-1</sup>
AFA Grease	25	22.5 to 27.5	11.27	11.27	12.25	14.6
Grease of manufacturer I	130	117 to 143	14.6	23.13	31.16	43.12
Grease of manufacturer K	15.3	13.8 to 16.8	12.64	12.05	13.03	14.41
Lubricant VG32	32	28.8 to 35.2	11.17	10.78	13.43	14.7

Note) The values of the competitors' greases are that of low-torque greases.

## THK Original Grease

## AFB-LF Grease

- Base oil: refined mineral oil
- Consistency enhancer: lithium-based

AFB-LF Grease is a general-purpose grease developed with a lithium-based consistency enhancer using refined mineral oil as the base oil. It excels in extreme pressure resistance and mechanical stability.

**[Features]**

- (1) High extreme pressure resistance  
Compared with lithium-based greases available on the market, AFB-LF Grease has higher wear resistance and outstanding resistance to extreme pressure.
- (2) High mechanical stability  
AFB-LF Grease is not easily softened and demonstrates excellent mechanical stability even when used for a long period of time.
- (3) High water resistance  
AFB-LF Grease is a highly water resistant grease that is less vulnerable to moisture penetration and little decreases resistance to extreme pressure.

**[Representative Physical Properties]**

Test item	Representative value	Test method
Worked penetration (25°C, 60W)	275	JIS K 2220 7
Dropping point: °C	193	JIS K 2220 8

Service Temperature Limit (°C)	-15 to 100	—

## THK Original Grease

# AFC Grease

- Base oil: high-grade synthetic oil
- Consistency enhancer: urea-based

AFC Grease has high fretting-corrosion resistance due to a special additive and a urea-based consistency enhancer using a high-grade synthetic oil as the base oil.

### [Features]

- (1) High fretting-corrosion resistance  
AFC Grease is designed to be highly effective in preventing fretting corrosion.
- (2) Long service life  
Unlike ordinary soap based grease for metal lubrication, AFC Grease excels in antioxidation stability and therefore can be used for a long period of time. As a result, maintenance work is reduced.
- (3) Wide temperature range  
Since a high-grade synthetic oil is used as the base oil, the lubricating performance remains high over a wide range of temperatures from -54 °C to +177 °C.

### [Representative Physical Properties]

Test item	Representative value	Test method
Worked penetration (25°C, 60W)	288	JIS K 2220 7
Dropping point: °C	269	JIS K 2220 8

After travel (fretting corrosion observed)

## THK Original Grease

# AFE-CA Grease

- Base oil: high-grade synthetic oil
- Consistency enhancer: urea-based

AFE-CA Grease uses urea as a consistency enhancer and a high-grade synthetic oil as the base oil. It has low dust generative characteristics and is therefore a suitable grease for clean room environments.

### [Features]

#### (1) Low dust generation

Compared with vacuum greases in conventional use, AFE-CA Grease generates less dust and therefore is ideal for use in clean rooms.

#### (2) Long service life

Unlike ordinary soap based grease for metal lubrication, AFE-CA Grease excels in antioxidation stability and therefore can be used for a long period of time. As a result, maintenance work is reduced.

### [Representative Physical Properties]

### [Test Data on Low Dust Generative Characteristics]

#### ● Test Data on AFE-CA Grease (Comparison of Particle Accumulation)

The test data in the figure shows the result of comparing particle accumulation between AFE-CA Grease with another grease.

<Test conditions>

Item	Description
Sample model No.	THK KR4610
Screw Ball rotational speed	1000min <sup>-1</sup>
Stroke	210mm
Grease quantity	2 cc in both the Ball Screw and the LM Guide
Flow rate during measurement	1ℓ/min
Measuring instrument	Dust counter
Particle size	0.5μm

## THK Original Grease

# AFF Grease

- Base oil: high-grade synthetic oil
- Consistency enhancer: lithium-based

AFF Grease uses a high-grade synthetic oil, lithium-based consistency enhancer and a special additive. It achieves stable rolling resistance, low dust generation and high fretting resistance, at a level that conventional vacuum greases or low dust generation greases have not reached.

### [Features]

- (1) Stable rolling resistance  
Since the viscous resistance is low, the rolling resistance fluctuation is also low. Thus, superb conformity is achieved at low speed.
- (2) Low dust generation  
AFF Grease generates little dust, making itself an ideal grease for use in clean rooms.
- (3) Fretting resistance  
Since AFF Grease is highly resistant to wear from microvibrations, it allows the greasing interval to be extended.

### [Representative Physical Properties]

Test item	Representative value	Test method
Worked penetration (25°C, 60W)	315	JIS K 2220 7

Feeding speed	1mm/s
Stroke	3mm

## THK Original Grease

# AFG Grease

- Base oil: high-grade synthetic oil
- Consistency enhancer: urea-based

AFG Grease is a high-grade grease for Ball Screws that uses a high-grade synthetic oil as the base oil and a urea-based consistency enhancer. It excels in low heat generation and supports a wide temperature range from low to high temperature.

### [Features]

- Low heat generation**  
Since the viscous resistance is low, the grease generates only a minimal level of heat even during high-speed operation.
- Low viscosity**  
Since the viscosity is low, a stable rotational torque is achieved.
- Wide temperature range**  
Maintains a high level of lubricity in a wide temperature range of  $-45^{\circ}\text{C}$  to  $+160^{\circ}\text{C}$ .
- Long service life**  
AFG Grease is not easily softened and excels in antioxidation stability even after a long-term operation.
- Water resistance**  
AFG Grease is a highly water resistant grease that is less vulnerable to moisture penetration and little decreases resistance to extreme pressure.

## Lubrication Equipment

# Grease Gun Unit MG70

● For detailed dimensions, see B-864.

Grease Gun Unit MG70 is capable of lubricating small to large types of LM Guides by replacing dedicated nozzles (attached). For small LM Guides, MG70 is provided with dedicated attachments. The user can select from these attachments according to the model number and the installation space.

MG70 has a slit window, allowing the user to check the remaining amount of grease.

It is equipped with a bellows cartridge that can hold 70 g of grease and is replaceable without smirching your hand. It supports a wide range of grease products, including AFA Grease, AFB-LF Grease, AFC Grease and AFE-CA Grease, to meet varied conditions. This enables you to make a selection according to the area requiring grease. (See A-959 to A-969.)

Since the grease to be used is sold separately, you must purchase it separately.

## Accessories for Lubrication

# Special Plumbing Fixtures

● For detailed dimensions, see B-865.

For centralized greasing and oil lubrication, special plumbing fixtures are available from THK. When ordering an LM system, specify the model number, mounting orientation and piping direction. We will ship the LM system attached with the corresponding fixture.

## Accessories for Lubrication

# Grease Nipple

● For detailed dimensions, see B-866.

THK provides various types of grease nipples needed for the lubrication of LM systems.

## SI Unit Conversion Table

### [Conversion to SI Units]

Amount	Name of unit	Symbol	Factor of conversion to SI	Name of SI unit	Symbol
Angle	Degree	°	$\pi/180$	Radian	rad
	Minute	'	$\pi/10800$		
	Second	''	$\pi/648000$		
Length	Meter	m	1	Meter	m
	Angstrom	Å	$10^{-10}$		
	X-ray unit		$\approx 1.00208 \times 10^{-13}$		
	Nautical mile	n mile	1852		
Area	Square meter	m <sup>2</sup>	1	Square meter	m <sup>2</sup>
	Are	a	10 <sup>2</sup>		
	Hectare	ha	10 <sup>4</sup>		
Volume	Cubic meter	m <sup>3</sup>	1	Cubic meter	m <sup>3</sup>
	Liter	ℓ (L)	10 <sup>-3</sup>		
Mass	Kilogram	kg	1	Kilogram	kg
	Ton	t	10 <sup>3</sup>		
	Atomic-mass unit	u	$\approx 1.66057 \times 10^{-27}$		
Time	Second	s	1	Second	S
	Minute	min	60		
	Hour	h	3600		
	Day	d	86400		
Speed	Meter per second	m/s	1	Meter per second	m/s
	Knot	kn	1852/3600		
Frequency	cycle	s <sup>-1</sup>	1	Hertz	Hz
Rotational speed	Revolution per minute	rpm	1	Per minute	min <sup>-1</sup>
Angular velocity	Radian per minute	rad/s	1	Radian per minute	rad/s
Acceleration	Meter per second per second	m/s <sup>2</sup>	1	Meter per second per second	m/s <sup>2</sup>
	G	G	9.80665		
Force	Weight kilogram	kgf	9.80665	Newton	N
	Weight ton	tf	9806.65		
	Dyne	dyn	10 <sup>-5</sup>		
Moment of force	Weight kilogram meter	kgf-m	9.80665	Newton meter	N-m
Stress and pressure	Weight kilogram per square meter	kgf/m <sup>2</sup>	9.80665	Pascal	Pa
	Weight kilogram per square centimeter	kgf/cm <sup>2</sup>	$9.80665 \times 10^4$		
	Weight kilogram per square millimeter	kgf/mm <sup>2</sup>	$9.80665 \times 10^6$		
Pressure	Water column meter	mH <sub>2</sub> O	9806.65	Pascal	Pa
	Mercury column meter	mmHg	101325/760		
	Torr	Torr	101325/760		
	Atmosphere	atm	101325		
	Bar	bar	10 <sup>5</sup>		
Energy	Erg	erg	10 <sup>-7</sup>	Joule	J
	IT calorie	cal <sub>IT</sub>	4.1868		
	Weight kilogram meter	kgf-m	9.80665		
	Kilowatt hour	kW·h	$3.600 \times 10^6$		
	Metric Horsepower hour	PS·h	$\approx 2.64779 \times 10^6$		
Electron volt	eV	$\approx 1.60219 \times 10^{-19}$			
Power	Watt	W	1	Watt	W
	Metric Horsepower	PS	$\approx 735.5$		
	Kilogram force-meter	kgf-m/s	9.80665

## THK General Catalog

# Index of Model Numbers

<b>A</b>	
AFA [Accessories for Lubrication] .....	<b>A-959</b>
AFB-LF [Accessories for Lubrication] .....	<b>A-960</b>
AFC [Accessories for Lubrication] .....	<b>A-961</b>
AFE-CA [Accessories for Lubrication] .....	<b>A-963</b>
AFF [Accessories for Lubrication] .....	<b>A-965</b>
AFG [Accessories for Lubrication] .....	<b>A-968</b>
Model AL [Link Ball] .....	<b>A-922</b>
Model A-M6F [Accessories for Lubrication] .....	<b>A-970</b>
Model A-MT6x1 [Accessories for Lubrication] .....	<b>A-970</b>
Model A-PT1/8 [Accessories for Lubrication] .....	<b>A-970</b>

<b>B</b>	
Model BF [Ball Screw (Peripherals)] .....	<b>A-802</b>
Model BIF [Ball Screw (Finished Shaft Ends)] ....	<b>A-764</b>
Model BIF [Ball Screw (Unfinished Shaft Ends)] .	<b>A-754</b>
Model BK [Ball Screw (Peripherals)] .....	<b>A-802</b>
Model BL [Link Ball] .....	<b>A-922</b>
Model BLK [Ball Screw] .....	<b>A-764</b>
Model BLK [Ball Screw (Rolled)] .....	<b>A-790</b>
Model BLR [Ball Screw (Precision)] .....	<b>A-772</b>
Model BLR [Ball Screw (Rolled)] .....	<b>A-796</b>
Model BLW [Ball Screw] .....	<b>A-764</b>
Model B-M6F [Accessories for Lubrication] .....	<b>A-970</b>
Model B-MT6x1 [Accessories for Lubrication] .....	<b>A-970</b>
Model BNF [Ball Screw (Finished Shaft Ends)] ...	<b>A-764</b>
Model BNF [Ball Screw (Unfinished Shaft Ends)] ...	<b>A-754</b>
Model BNFN [Ball Screw (Finished Shaft Ends)] ....	<b>A-764</b>
Model BNFN [Ball Screw (Unfinished Shaft Ends)] .	<b>A-754</b>
Model BNK [Ball Screw] .....	<b>A-760</b>
Model BNS [Ball Screw] .....	<b>A-780</b>
Model BNS-A [Ball Screw] .....	<b>A-780</b>
Model BNT [Ball Screw (Precision)] .....	<b>A-764</b>
Model BNT [Ball Screw (Rolled)] .....	<b>A-790</b>
Model B-PT1/8 [Accessories for Lubrication] .....	<b>A-970</b>
Model BS [LM Stroke] .....	<b>A-562</b>
Model BTK [Ball Screw] .....	<b>A-790</b>

<b>C</b>	
Cap C [LM Guide (Options)] .....	<b>A-357</b>
Model CF [Cam Follower] .....	<b>A-880</b>
Model CF-A [Cam Follower] .....	<b>A-880</b>
Model CFH-A [Cam Follower] .....	<b>A-880</b>
Model CFN [Cam Follower] .....	<b>A-880</b>
Model CFT [Cam Follower] .....	<b>A-880</b>
Model C-M6F [Accessories for Lubrication] .....	<b>A-970</b>

Model C-MT6x1 [Accessories for Lubrication] ...	<b>A-970</b>
Model CNF [Ball Screw] .....	<b>A-790</b>
Model C-PT1/8 [Accessories for Lubrication] .....	<b>A-970</b>
Model CSR [LM Guide] .....	<b>A-244</b>

<b>D</b>	
Model D20 [Slide Rail] .....	<b>A-646</b>
Model DC [Lead Screw Nut] .....	<b>A-830</b>
Model DCM [Lead Screw Nut] .....	<b>A-830</b>
Model DCMA [Change Nut] .....	<b>A-842</b>
Model DCMB [Change Nut] .....	<b>A-842</b>
Model DIK [Ball Screw] .....	<b>A-764</b>
Model DIR [Ball Screw] .....	<b>A-772</b>
Model DK [Ball Screw] .....	<b>A-764</b>
Model DKN [Ball Screw] .....	<b>A-764</b>
Model DP [Spline Nut] .....	<b>A-514</b>
Model DPM [Spline Nut] .....	<b>A-514</b>

<b>E</b>	
Model E15 [Slide Rail] .....	<b>A-646</b>
Model E20 [Slide Rail] .....	<b>A-646</b>
Model EF [Ball Screw (Peripherals)] .....	<b>A-802</b>
Model EK [Ball Screw (Peripherals)] .....	<b>A-802</b>
Model EP [LM Guide (Options)] .....	<b>A-366</b>
Model ER [Precision Linear Pack] .....	<b>A-566</b>

<b>F</b>	
Model FBL27D [Slide Rail] .....	<b>A-646</b>
Model FBL27S [Slide Rail] .....	<b>A-646</b>
Model FBL27S-P14 [Slide Rail] .....	<b>A-646</b>
Model FBL35B [Slide Rail] .....	<b>A-646</b>
Model FBL35D [Slide Rail] .....	<b>A-646</b>
Model FBL35E-P14 [Slide Rail] .....	<b>A-646</b>
Model FBL35F [Slide Rail] .....	<b>A-646</b>
Model FBL35G-P13 [Slide Rail] .....	<b>A-646</b>
Model FBL35G-P14 [Slide Rail] .....	<b>A-646</b>
Model FBL35J [Slide Rail] .....	<b>A-646</b>
Model FBL35J-P13 [Slide Rail] .....	<b>A-646</b>
Model FBL35J-P14 [Slide Rail] .....	<b>A-646</b>
Model FBL35K [Slide Rail] .....	<b>A-646</b>
Model FBL35M [Slide Rail] .....	<b>A-646</b>
Model FBL35S [Slide Rail] .....	<b>A-646</b>
Model FBL35T [Slide Rail] .....	<b>A-646</b>
Model FBL35W [Slide Rail] .....	<b>A-646</b>
Model FBL48DR [Slide Rail] .....	<b>A-646</b>
Model FBL51H [Slide Rail] .....	<b>A-646</b>

Model FBL51H-P13 [Slide Rail] .....	<b>A-646</b>	Model LBS [Ball Spline].....	<b>A-484</b>
Model FBL51H-P14 [Slide Rail] .....	<b>A-646</b>	Model LBST [Ball Spline] .....	<b>A-484</b>
Model FBL56F [Slide Rail] .....	<b>A-646</b>	Model LD [Accessories for Lubrication].....	<b>A-970</b>
Model FBL56H [Slide Rail] .....	<b>A-646</b>	Model LF [Ball Spline] .....	<b>A-490</b>
Model FBL56H-P13 [Slide Rail] .....	<b>A-646</b>	Model LF-A [Accessories for Lubrication] .....	<b>A-970</b>
Model FBL56H-P14 [Slide Rail] .....	<b>A-646</b>	Model LF-B [Accessories for Lubrication] .....	<b>A-970</b>
Model FBW [Slide Pack] .....	<b>A-636</b>	Model LF-C [Accessories for Lubrication] .....	<b>A-970</b>
Model FF [Ball Screw (Peripherals)] .....	<b>A-802</b>	Model LF-D [Accessories for Lubrication] .....	<b>A-970</b>
Model FK [Ball Screw (Peripherals)] .....	<b>A-802</b>	Model LF-E [Accessories for Lubrication] .....	<b>A-970</b>
Model FLM [Linear Bushing (Option)] .....	<b>A-550</b>	LiCS [LM Guide (Options)] .....	<b>A-355</b>
Model FT [Flat Roller] .....	<b>A-622</b>	Model LM [Linear Bushing] .....	<b>A-524</b>
Model FT-V [Flat Roller] .....	<b>A-622</b>	Model LME [Linear Bushing] .....	<b>A-524</b>
Model FTW [Flat Roller] .....	<b>A-622</b>	Model LMF [Linear Bushing] .....	<b>A-524</b>

## LIMITED WARRANTY

**LIMITED WARRANTY AND LIMITATION OF LIABILITY:** THK CO. LTD., FOR ITSELF AND ITS RELATED COMPANIES AND SUBSIDIARIES (HEREINAFTER DESCRIBED COLLECTIVELY AS "THK" ) WARRANTS THAT ALL THK PRODUCTS SOLD WILL BE FREE OF DEFECTS IN MATERIALS AND WORKMANSHIP FOR A PERIOD OF TWELVE (12) MONTHS FROM DATE OF DELIVERY. THE FOREGOING TWELVE (12) MONTH WARRANTY SHALL NOT BE EXTENDED OR CHANGED BY THK FURNISHING ANY REPLACEMENTS, ADDITIONS, ATTACHMENTS, ACCESSORIES OR REPAIRS TO THE PRODUCT SUBSEQUENT TO THE DATE OF DELIVERY OR ACCEPTANCE. THE FOREGOING WARRANTY IS THE SOLE AND EXCLUSIVE WARRANTY OF THK REGARDING THE PRODUCT.

**DISCLAIMER OF OTHER WARRANTIES:** OTHER THAN THE FOREGOING WARRANTY, THERE ARE NO EXPRESS OR IMPLIED WARRANTIES OR ANY AFFIRMATIONS OF FACT OR PROMISES BY THK WITH RESPECT TO THE PRODUCT. THK DISCLAIMS ANY WARRANTIES, EXPRESS, IMPLIED OR STATUTORY, NOT SPECIFICALLY SET FORTH ABOVE. WITHOUT LIMITING THE GENERALITY OF THE FOREGOING, THK EXPRESSLY DISCLAIMS ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR ANY PARTICULAR PURPOSE, INFRINGEMENT OR ANY REPRESENTATIONS OF FACT OR QUALITY NOT EXPRESSLY SET FORTH HEREIN.

**LIMITATION OF LIABILITY AND REMEDIES:** THK'S SOLE RESPONSIBILITY AND LIABILITY INCURRED AS A RESULT OF THE SALE AND/OR USE OF THE PRODUCT, AND THE PURCHASER'S EXCLUSIVE REMEDY AGAINST THK UNDER ANY WARRANTY SHALL BE LIMITED TO THE REPAIR OR REPLACEMENT, AT THK'S OPTION, OF PRODUCT COMPONENTS NOT CONFORMING TO THE WARRANTY. THE TOTAL LIABILITY OF THK SHALL IN NO EVENT EXCEED THE AMOUNT ACTUALLY PAID TO THK BY PURCHASER WITH RESPECT TO THE PRODUCT. THIS LIMITATION OF REMEDY IS INTENDED BY THE PARTIES TO SURVIVE EVEN IF THE REMEDY IS CLAIMED TO HAVE FAILED OF ITS ESSENTIAL PURPOSE. PURCHASER'S FULL AND COMPLETE PERFORMANCE OF ALL OBLIGATIONS OF PURCHASER RECITED IN THIS AGREEMENT IS A CONDITION PRECEDENT TO THK'S WARRANTY OBLIGATIONS AND LIABILITIES HEREIN.

**PURCHASER'S DAMAGES AND LIMITATIONS:** IN NO EVENT SHALL THK BE LIABLE TO PURCHASER, ITS ASSIGNS OR AGENTS, FOR ECONOMIC LOSS, INCIDENTAL OR CONSEQUENTIAL DAMAGES, IN CONTRACT OR IN TORT, INCLUDING BUT NOT LIMITED TO, ANY DAMAGES FOR LOST PROFITS, DOWN-TIME, LOST PRODUCTION, FAILURE TO MEET PURCHASER'S SALES CONTRACTS, OR DEFECTS IN PURCHASER'S MATERIALS OR WORKMANSHIP ARISING DIRECTLY OR INDIRECTLY FROM THE USE OF THE PRODUCT.

## DISCLAIMER

This Catalog provides basic information relating to THK linear motion and related products. The Catalog, including all information, charts, formulas, factors, accuracy standards, tolerances and application recommendations contained herein, is only a starting point for the customer's selection of appropriate products, and may not apply in all intended applications. The Catalog is not a substitute for a proper application analysis conducted by an experienced, knowledgeable design engineer. Product selection should be based upon your specific application needs and conditions, which will vary greatly depending on many factors. No specific product application should be based solely on the information contained in this Catalog. All purchases of THK Products are subject to the limited warranty offered by THK Co., Ltd, for itself and on behalf of its related companies and subsidiaries. Customers should confirm independently that a contemplated application is safe, appropriate and effective.

"All trademarks used in this Catalog are registered trademarks in the Country of Japan. If there is any question as to the validity of such trademarks outside of Japan, an inquiry should be made in that particular country."
